

# MITSUBISHI

Temperature-Digital Converter Module type A616TD

User's Manual

Mitsubishi Programmable Controller

# ● SAFETY PRECAUTIONS ●

(Read these precautions before using.)

When using Mitsubishi equipment, thoroughly read this manual and the associated manuals introduced in this manual.

Also pay careful attention to safety and handle the module properly. These precautions apply only to Mitsubishi equipment. Refer to the user's manual of the CPU module to use for a description of the PLC system safety precautions.

These ● SAFETY PRECAUTIONS ● classify the safety precautions into two categories: "DANGER" and "CAUTION".

 <b>DANGER</b>	<b>Procedures which may lead to a dangerous condition and cause death or serious injury if not carried out properly.</b>
 <b>CAUTION</b>	<b>Procedures which may lead to a dangerous condition and cause superficial to medium injury, or physical damage only, if not carried out properly.</b>

Depending on circumstances, procedures indicated by  CAUTION may also be linked to serious results.

In any case, it is important to follow the directions for usage.

Store this manual in a safe place so that you can take it out and read it whenever necessary. Always forward it to the end user.

## [Cautions on Design]

### CAUTION

- Do not bundle control lines or communication wires together with main circuit or power lines, or lay them close to these lines.  
As a guide, separate the lines by a distance of at least 100mm, otherwise malfunctions may occur due to noise.

## [Cautions on Mounting]

### CAUTION

- Use the PLC in an environment that conforms to the general specifications in this manual.  
Using the PLC in environments outside the ranges stated in the general specifications will cause electric shock, fire, malfunction, or damage to/deterioration of the product.
- Make sure that the module fixing projection on the base of the module is properly engaged in the module fixing hole in the base unit before mounting the module.  
Failure to mount the module properly will result in malfunction or failure, or in the module falling.

## [Cautions on Wiring]

- Always ground the FG, FG1 and FG2 terminals to the protective ground conductor.  
Doing so may cause malfunction.
- Carry out wiring to the PLC correctly, checking the rated voltage and terminal arrangement of the product.  
Using a power supply that does not conform to the rated voltage, or carrying out wiring incorrectly, will cause fire or failure.
- Tighten the terminal screws within the specified torque range.  
Undertightening can cause a short circuit or malfunction.  
Overtightening can cause a short circuit or malfunction due to damage of the screws or module.
- Make sure that no foreign matter such as chips or wiring offcuts gets inside the module.  
It will cause fire, failure or malfunction.

## [Cautions on Startup and Maintenance]

- Do not touch terminals while the power is ON.  
This will cause malfunctions.
- Always start cleaning or terminal screw retightening after switching power off externally in all phases.  
Not doing so can cause the module to fail or malfunction.
- Do not disassemble or modify the module.  
This will cause a failure, malfunction, injury or fire.
- Always turn off all external power supply phases before mounting or dismounting the module.  
Failure to do this may result in malfunction or damage to the module.

## [Cautions on Disposal]

- Dispose of this product as industrial waste.

## Conformation to the EMC Directive and Low Voltage Instruction

For details on making Mitsubishi PLC conform to the EMC directive and low voltage instruction when installing it in your product, please see Chapter 3, "EMC Directive and Low Voltage Instruction" of the User's Manual (Hardware) of the PLC CPU to use.

The CE logo is printed on the rating plate on the main body of the PLC that conforms to the EMC directive and low voltage instruction.

By making this product conform to the EMC directive and low voltage instruction, it is not necessary to make those steps individually.

1. INTRODUCTION

This manual gives specifications, handling, programming procedures, etc. for the A616TD temperature-digital converter module for use with the MELSEC-A series CPU module.

When connected with the A60MXT isolated multiplex module (hereafter abbreviated to the A60MXT) or A60MXTN thermocouple I/P multiplexer (channel isolated) (hereafter abbreviated to the A60MXTN), the A616TD allows external temperature sensor (thermocouple) input values into 16-bit, signed BIN temperature values or 16-bit, signed BIN (data part: 12 bits) digital values. (The A60MXT and A60MXTN are hereafter abbreviated generically to the A60MXT. Note that if specifications differ between the A60MXT and A60MXTN, the specifications of the A60MXT and A60MXTN are described separately.)

When connected directly with the A60MX non-isolated multiplex module (hereafter abbreviated to the A60MX), A60MXR isolated multiplex module (hereafter abbreviated to the A60MXR) or A60MXRN analog I/P multiplexer (channel isolated) (hereafter abbreviated to the A60MXRN), the A616TD also accepts other sensors than temperature sensors and converts analog input values into 16-bit, signed BIN (data part: 12 bits) digital values. (The A60MXR and A60MXRN are hereafter abbreviated generically to the A60MXR. Note that if specifications differ between the A60MXR and A60MXRN, the specifications of the A60MXR and A60MXRN are described separately.) Hereafter, A60MX is used to denote any type of A60MX module, for example: A60MXT, A60MX, A60MXR.

Module combination	Thermo-couples	Non-thermocouple sensors		Configu-ration Drg.
		0 to 10V	-10 to 10V, -20 to 20mA

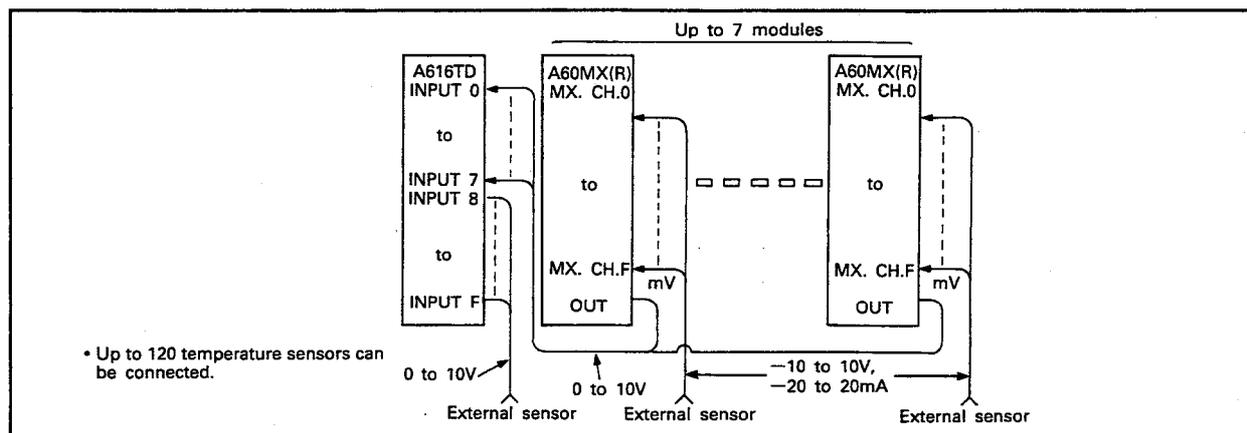

Fig. 1.3 A616TD+A60MX(A60MXR) Combination

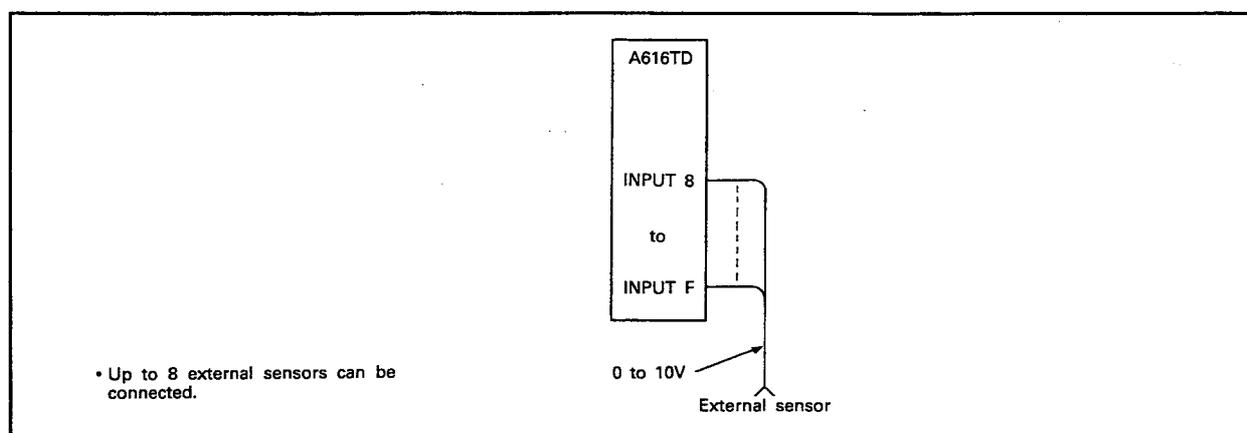

Fig. 1.3 A616TD Stand-Alone Operation

## 1.1 Features

- (1) A maximum of seven A60MX modules can be connected to A616TD channels 0 to 7. Up to 105 temperature sensors (thermocouples) can be connected if all seven of the modules are of the A60MXT type. Alternatively, if all of the modules are of the A60MX and/or A60MXR type, a total of up to 120 external sensors can be connected.
- (2) A total of 420 temperature sensors can be connected if A616TD-A60MXT combinations are installed in all 64 slots available with the maximum configuration of a single-CPU stand-alone system. Using A616TD-A60MX or A60MXR combinations, up to 960 external sensors can be connected.
- (3) The A60MXT permits the connection of thermocouples meeting four different Japanese and overseas standards: JIS, ANSI, DIN and BS.
- (4) The thermoresistor (PT100) connected to channel 0 of the A60MXT automatically carries out cold-junction compensation.
- (5) Wiring discontinuity detection settings and error compensation can be enabled for each A60MXT channel.

The following abbreviations are used for various types of CPU in this User's Manual.

## (1) Sequencer CPU

A1CPU(P21/R21)	A2UCPU
A2CPU(P21/R21)	A2UCPU-S1
A2CPU-S1(P21/R21)	A3UCPU
A3CPU(P21/R21)	A4UCPU
A1NCPU(P21/R21)	A73CPU(P21/R21)
A2NCPU(P21/R21)	A3MCPU(P21/R21)
A2NCPU-S1(P21/R21)	A81CPU
A3NCPU(P21/R21)	Q2ACPU
A3HCPU(P21/R21)	Q2ACPU-S1
A2ACPU(P21/R21)	Q3ACPU
A2ACPU-S1(P21/R21)	Q4ACPU
A3ACPU(P21/R21)	Q4ARCPU
A0J2CPU(P23/R23)	
A0J2HCPU(P21/R21)	
A52GCPU(T21B)	

## (2) Building block type CPU

A1CPU(P21/R21)	A2UCPU
A2CPU(P21/R21)	A2UCPU-S1
A2CPU-S1(P21/R21)	A3UCPU
A3CPU(P21/R21)	A4UCPU
A1NCPU(P21/R21)	A73CPU(P21/R21)
A2NCPU(P21/R21)	A3MCPU(P21/R21)
A2NCPU-S1(P21/R21)	A81CPU
A3NCPU(P21/R21)	Q2ACPU
A3HCPU(P21/R21)	Q2ACPU-S1
A2ACPU(P21/R21)	Q3ACPU
A2ACPU-S1(P21/R21)	Q4ACPU
A3ACPU(P21/R21)	Q4ARCPU

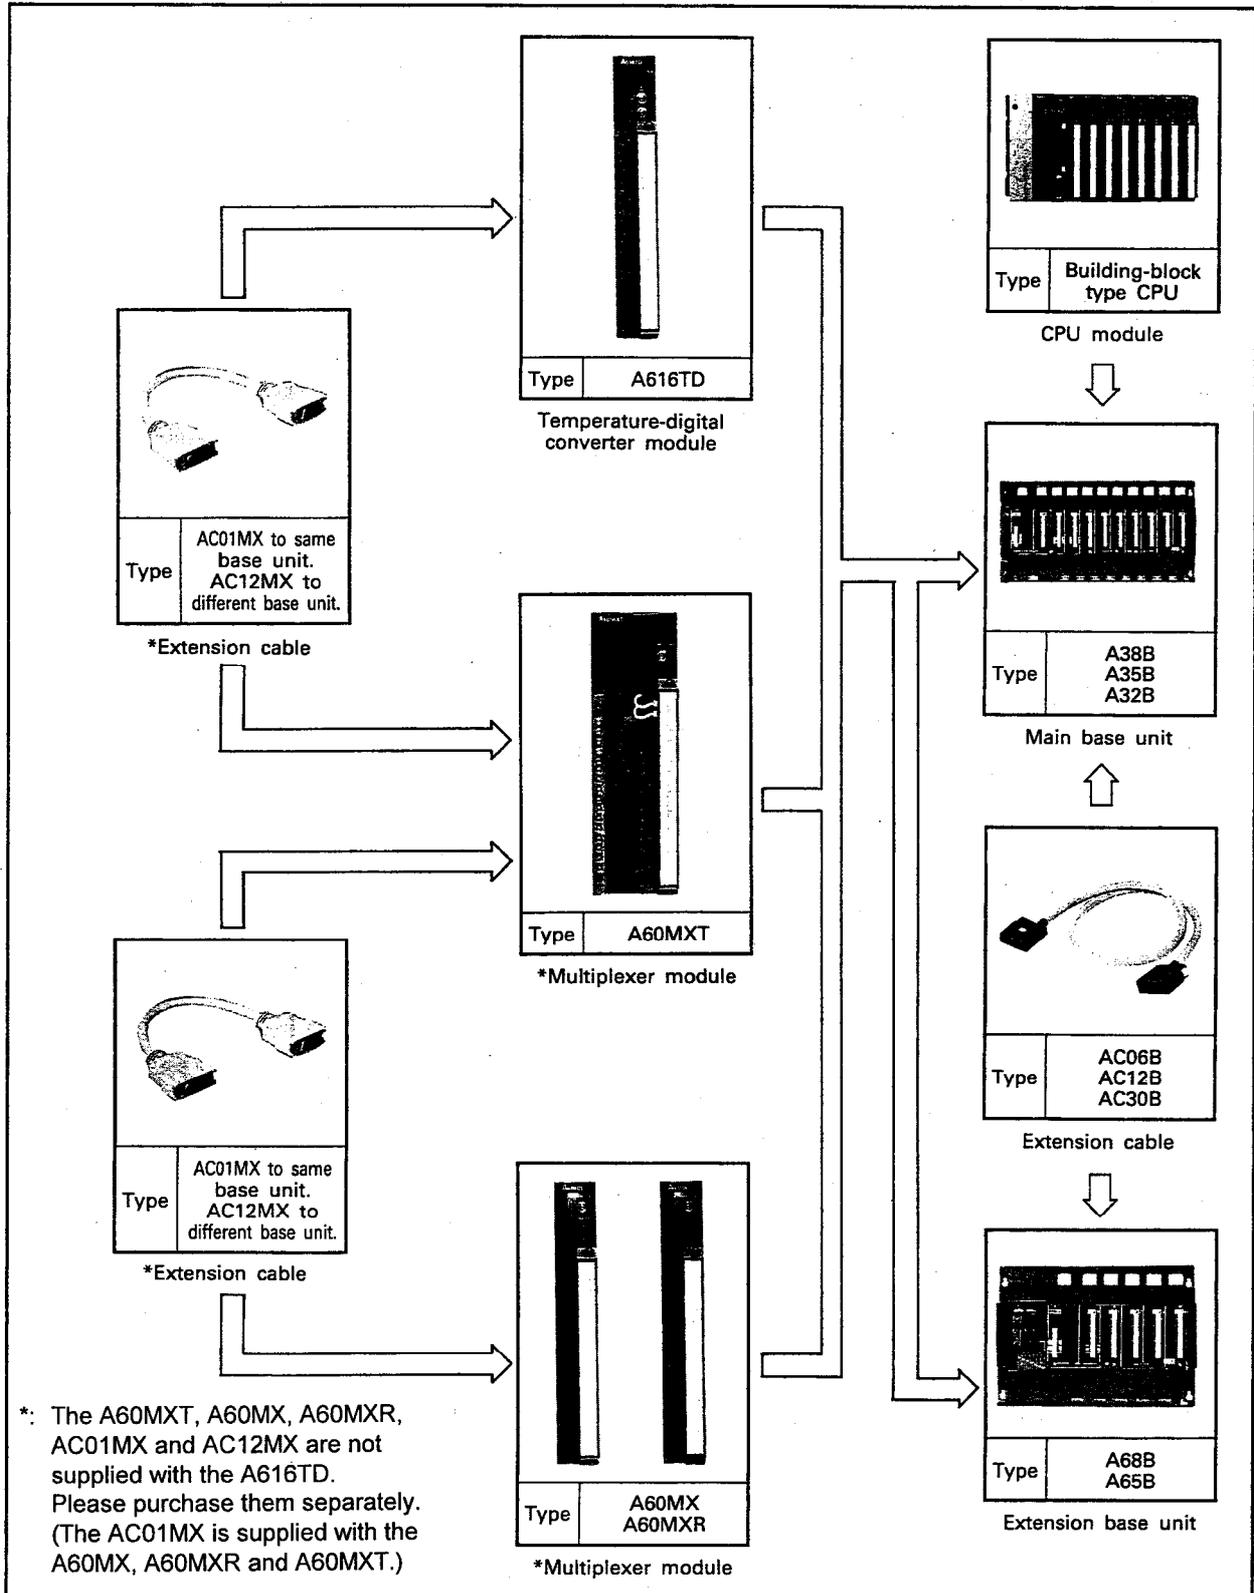

## (3) Compact-type CPU

A0J2CPU(P23/R23)  
A0J2HCPU(P21/R21)  
A52GCPU(T21B)

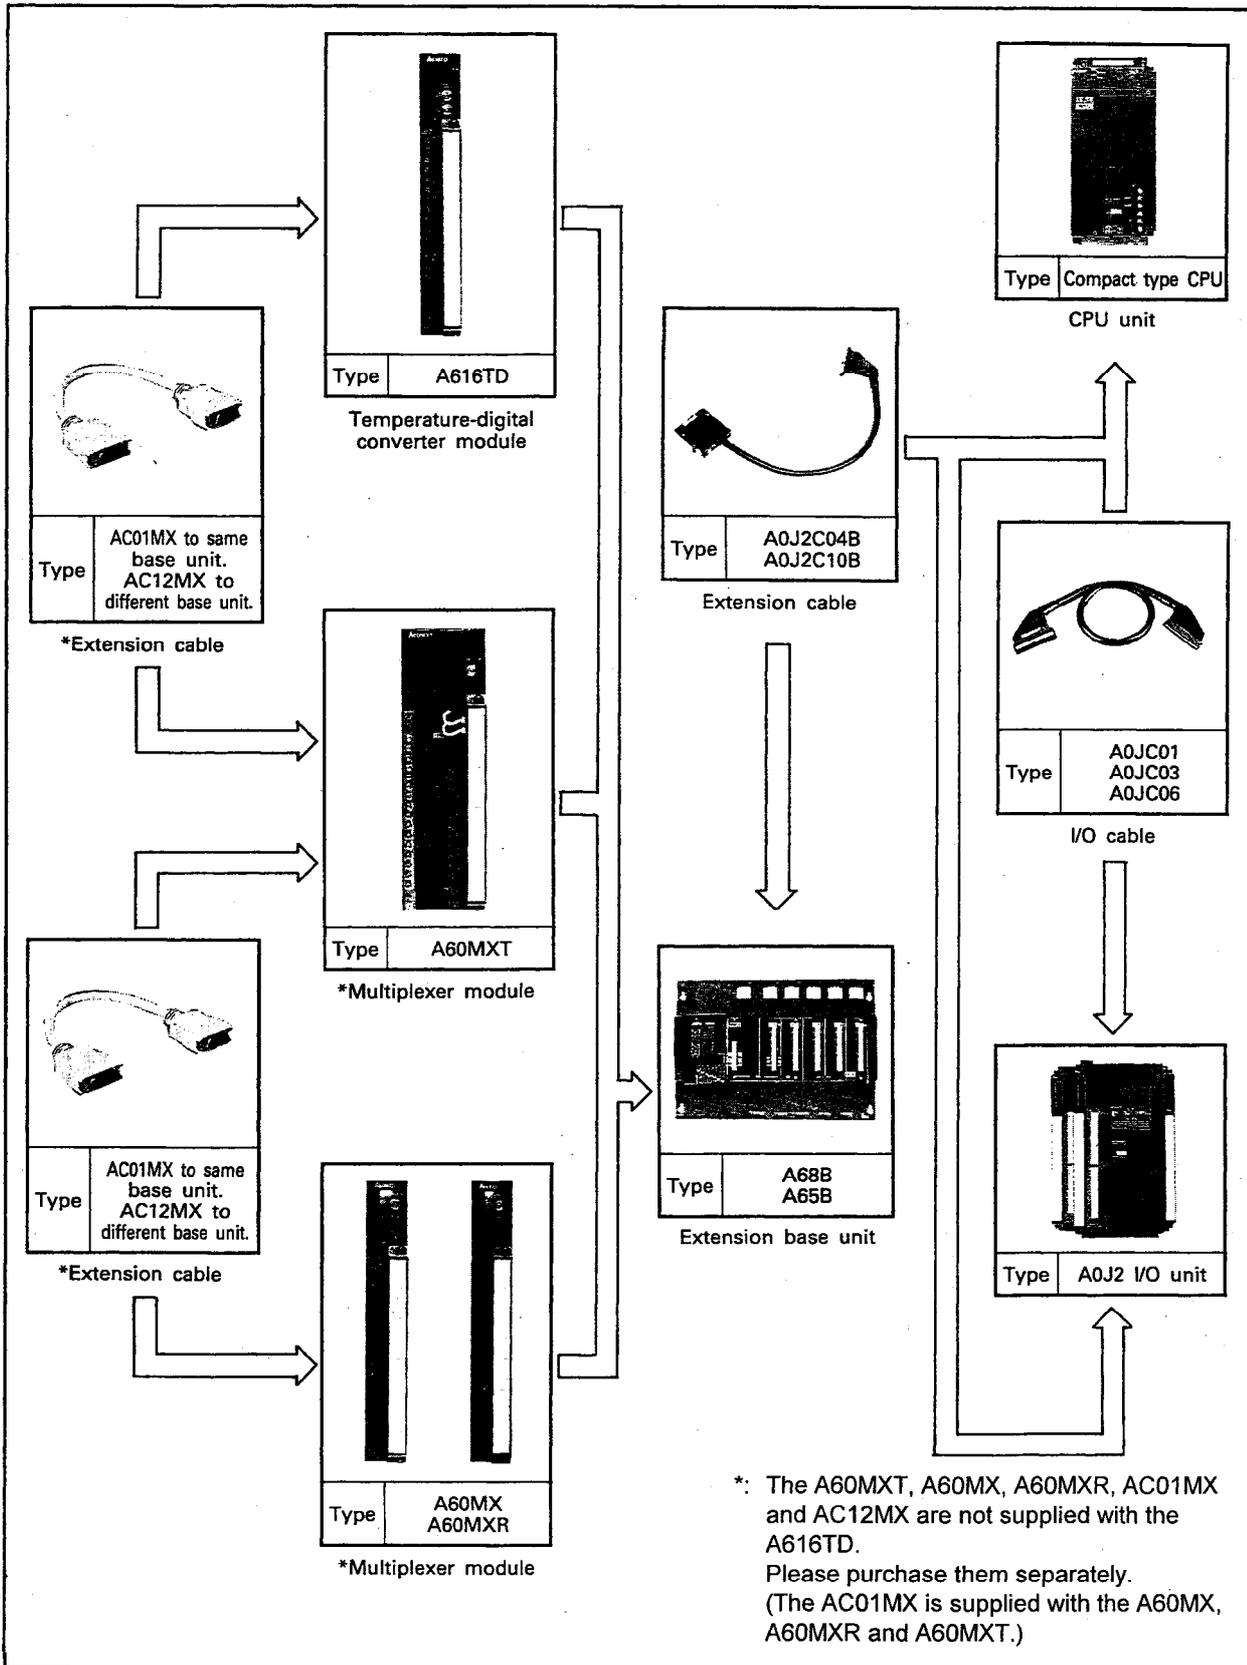

### 2. SYSTEM CONFIGURATION

#### 2.1 Overall Configuration

(1) System using the A616TD with building block type CPU

(2) System using the A616TD with compact CPU

### 2.2 Notes on Use of A616TD in System

The A616TD can be used with the following CPU modules:

Applicable CPU modules		
A0J2CPU	A3UCPU	A1SJCPU(S3)
A0J2HCPU	A4UCPU	A1SJHCPU(S8)
A1NCPUCPU	A73CPU	A1SCPU(S1)
A2NCPUCPU	A81CPU	A1SCPUC24-R2
A2NCPUCPU-S1	A1CPU	A1SHCPU
A3NCPUCPU	A2CPU	A2SCPU(S1)
A3HCPUCPU	A2CPU-S1	A2SHCPU(S1)
A3MCPUCPU	A3CPU	A2ACPU(S1/S30)
A2ACPU	Q2ACPU	A2USHCPU-S1
A2ACPU-S1	Q2ACPU-S1	Q2ASCPU(S1)
A3ACPU	Q3ACPU	Q2ASHCPU(S1)
A2UCPU	Q4ACPU	A52GCPUCPU
A2UCPU-S1	Q4ARCPUCPU	

The A616TD may be loaded onto any slot of the base unit with the following precautions:

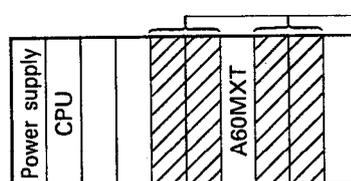

- (1) The power supply capacity will be exceeded if the A616TD is loaded into an A5□ type extension base unit, as this type of base unit contains no power supply.  
Therefore, if the A616TD is to be loaded into an extension base unit, the extension base unit must be of the A6□ type which incorporates a built-in power supply.
- (2) The A616TD cannot be used on the last slot of the seventh extension stage in an A3CPU(P21/R21) system.
- (3) On a data link system, the A616TD can be mounted to any of the following: master station, local station or remote I/O station.  
Refer to the MELSECNET, MELSECNET/B data link system reference manual for examples of programs for remote I/O stations.

#### POINT

**The A616TD cannot be used on the A0J2P25/R25 (remote I/O station)**

### 2.3 Notes on Configuring a System

- (1) Do not feed the input/output module into either of the pairs of slots to the left and right of the A60MXT.  
If the input/output module is loaded into these slots, the noise it generates may prevent stable temperature measurements.

Do not load the input/output module into these slots.

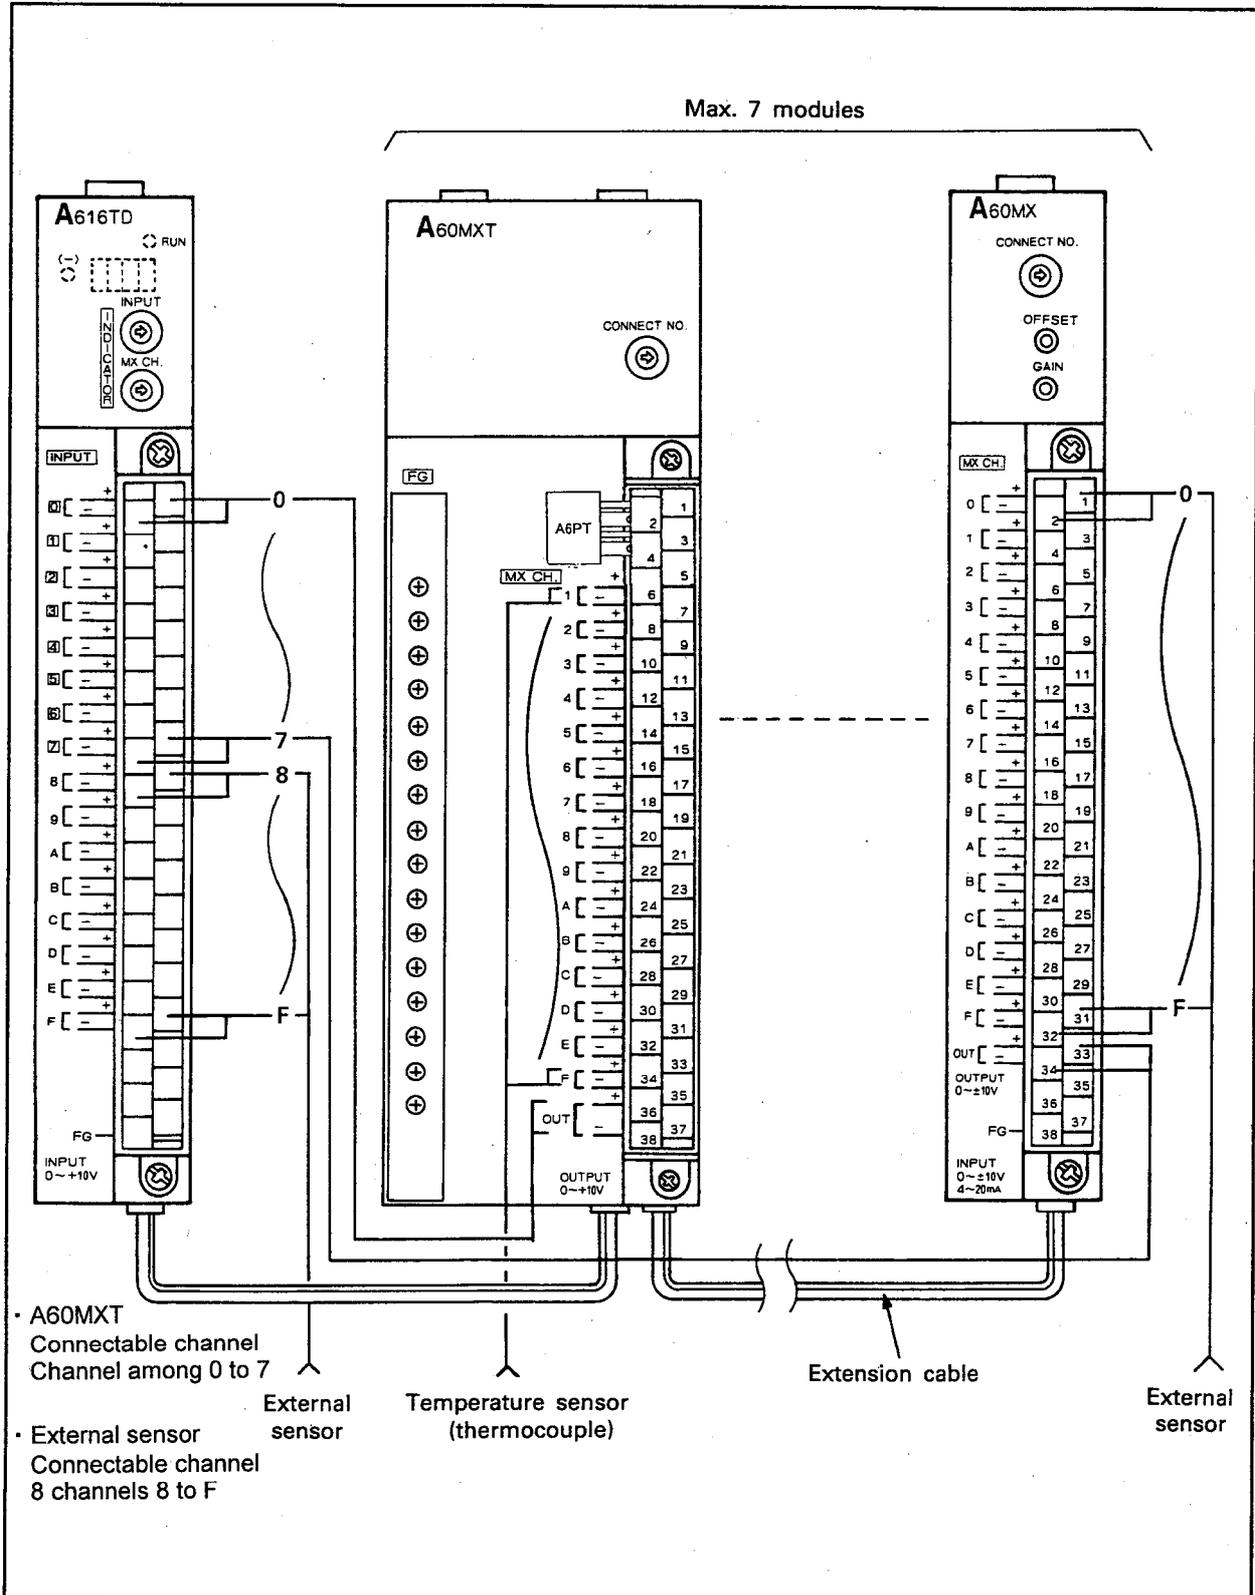

- (2) Up to seven modules may be loaded by connecting the OUT terminal of the A60MX[ ] with any of the A616TD INPUT channels 0 to 7.  
The A60MX[ ] cannot be used independently.
- (3) External sensors cannot be connected directly to any of the eight A616TD INPUT channels 0 to 7.
- (4) A special extension cable, ACO1MX, is required to connect the A616TD to an A60MX[ ] module.  
A special extension cable, AC12MX, is required to connect the A616TD to another base unit. Only an A60MX[ ] module may be loaded between an A616TD and another A60MX[ ] module, or between two A60MX[ ] modules on any one base unit. Always load the A616TD to the left of an A60MX[ ] module.
- (5) The A616TD A/D conversion characteristics fixed to convert an analog input of 0 to 10V to the range 0 to 4000 or -2000 to 2000. These ranges cannot be changed by the user.  
An A60MX or A60MXR module must be loaded if connecting external sensors producing an analog input outside the range 0 to 10 V.
- (6) The A60MXT channels are isolated by mercury-plunger relays, and the A60 MXTN channels are isolated by photo MOS relays. The channels specified for discontinuity detection are non-isolated (20M( resistance isolated) by the discontinuity detection circuit.
- (7) The A60MXT and A60MX are not isolated between channels but 1M  $\Omega$  resistor isolation minimizes influence between the channels.
- (8) The inter-channel dielectric withstand voltage of the A60MXT and A60MXR is 500VDC (accuracy guarantee 500VDC) and that of the A60MXTN and A60MXRN is 400VDC (A60MXTN: accuracy guarantee 100VDC, A60MXRN: accuracy guarantee 400VDC).
- (9) Discontinuity detection may not be enabled for channels to which tip-grounded thermocouples are connected.  
When discontinuity detection is specified, a potential difference caused by a grounding resistance difference occurs between the tip grounding point of the thermocouple and the grounding point on the discontinuity detection circuit side, producing a detection error.
- (10) The sampling period is set automatically according to the number of channels for which conversion is enabled.  
The sampling period cannot be specified by the user.
- (11) The A616TD may only be loaded to the first four slots of the extension base unit used with the A0J2CPU.
- (12) When the A60MXT or A60MXR is used, never mount the module horizontally or vertically. If you do so, the internal mercury-plunger relays may not operate properly.  
When the A60MXTN or A60MXRN is used, there are no restrictions on mounting.
- (13) For wiring, always take noise reduction measures in the methods given in Sections 4.6 and 4.7.

## 2. SYSTEM CONFIGURATION

# MELSEC-A

### 2.4 Module Connection

The configuration of the connection of A60MXT, A60MX or A60MXR modules to the A616TD are shown in the diagram below.

### 3. SPECIFICATIONS

#### 3.1 General Specifications

Table 3.1 shows the common specifications of various units used.

Item	Specifications				
Operating ambient temperature	0 to 55°C				
Storage ambient temperature	-20 to 75°C				
Operating ambient humidity	10 to 90%RH, non-condensing				
Storage ambient humidity	10 to 90%RH, non-condensing				
Vibration resistance	Conforms to *JIS C 0911	Frequency	Acceleration	Amplitude	Sweep Count
		10 to 55Hz	—	0.075mm	10 times
		55 to 150Hz	1g	—	*(1 octave/minute)
Shock resistance	Conforms to JIS C 0912 (10g × 3 times in 3 directions)				
Noise durability	By noise simulator of 150Vpp noise voltage, 1 μs noise width and 25 to 60Hz noise frequency				
Dielectric withstand voltage	1500V AC for 1 minute across AC external terminals and ground 500V AC for 1 minute across DC external terminals and ground				
Insulation resistance	5MΩ or larger by 500V DC insulation resistance tester across AC external terminals and ground				
Grounding	Class 3 grounding; grounding is not required when it is impossible.				
Operating ambience	Free of corrosive gases. Dust should be minimal.				
Cooling method	Self-cooling				

Table 3.1 General Specifications

#### REMARKS

One octave marked \* indicates a change from the initial frequency to double or half frequency. For example, any of the changes from 10Hz to 20Hz, from 20Hz to 40Hz, from 40Hz to 20Hz, and 20Hz to 10Hz are referred to as one octave.

\*JIS: Japanese Industrial Standard

### 3. SPECIFICATIONS

#### 3.2 Performance Specifications

The performance specifications of the A616TD, A60MXT, A60MXTN, A60MX, A60MXR and A60MXRN modules are listed below.

##### 3.2.1 Performance of the A616TD, A60MXT and A60MXTN combination

The performance specifications of the A616TD, A60MXT and A60MXTN combination are listed in the table below.

Item		Specifications	Reference																																																																																																																																																																																																		
Temperature sensor input (°C)		-200 to 1800	—																																																																																																																																																																																																		
Output	Digital output values	Binary digital values (0 to 4000) with a 16-bit sign (12 data bits). Table 3.2 A616TD, A60MXT and A60MXTN Combination Performance List

\*1 The measurement ranges 2, 3, and 4 in the table are specified for a terminal-block (reference) temperature of 0°C. If the actual terminal-block temperature, measured by the thermoresistor, is non-zero the measurement ranges are changed according to this temperature difference as follows:

Measurement range { Upper limit=measurement range upper limit from table.  
Lower limit=terminal-block temperature.

Example

For a terminal-block temperature of 30°C and a JIS K type thermocouple, measurement range 2 becomes 30°C to 500°C.

\*1 applies to the temperature measurement ranges. Refer to the standards listed in the Appendices for the actual thermocouple temperature ranges.

An out-of-range signal is output if the measurement ranges described above are exceeded. Accuracy cannot be guaranteed if the actual temperature range is exceeded.

### 3. SPECIFICATIONS

#### 3.2.2 Performance of the A616TD, A60MX, A60MXR and A60MXRN combination

The performance specifications of the A616TD, A60MX, A60MXR and A60MXRN are listed in the table below.

Table 3.3 A616TD, A60MX, A60MXR and A60MXRN combination Performance List

3.2.3 A616TD performance list

The A616TD analog-input characteristics are listed in Table 3.4. For items not listed in this table, refer to the temperature-digital conversion characteristics in Table 3.2.

Item	Specifications						
Analog input voltage (V)	0 to +10 DC (Input resistance: 1MΩ)						
Digital output	Binary digital values with a 16-bit sign (-48 to 4047 or -2048 to 2047: can be selected for each channel)						
Max. resolution of I/O characteristics	<table border="1"> <thead> <tr> <th>Analog input range (V)</th> <th>Max. resolution</th> <th>Digital output values</th> </tr> </thead> <tbody> <tr> <td>0 to +10</td> <td>2.5mV (1/4000)</td> <td>0 to 4000 -2000 to 2000</td> </tr> </tbody> </table>	Analog input range (V)	Max. resolution	Digital output values	0 to +10	2.5mV (1/4000)	0 to 4000 -2000 to 2000
	Analog input range (V)	Max. resolution	Digital output values				
0 to +10	2.5mV (1/4000)	0 to 4000 -2000 to 2000					
Overall accuracy (%)	A616TD stand-alone operation: ±0.3 (Full-scale accuracy)						
Max. conversion speed (ms/channel)	1 for stand-alone A616TD						
Max. absolute input voltage (V)	±15						
Isolation	Between input terminals and PLC: Photocoupler isolation Between channels: Non-isolated (1MΩ resistor isolation)						
No. of analog input points (points per module)	16						
No. of I/O points occupied (points)	32						

Table 3.4 A616TD Performance List (for analog inputs)

#### 3.3 Temperature - Digital Conversion

The temperatures detected by the temperature sensors (thermocouples) are input to the A616TD input channels as a thermoelectromotive force.

The A60MXT switches input channels once each sampling period and amplifies the voltage input to each channel from its respective thermocouple into the voltage range 0 to 10V, and sends this voltage to the A616TD.

The A616TD converts the analog input voltages to digital values. As the relationship between the thermoelectromotive force and the temperature for the temperature sensors (thermocouples) sensors is non-linear, the converted digital values are linearized before being stored in buffer memory.

##### 3.3.1 Conversion characteristics

###### (1) Temperature detection characteristics

The A60MXT amplifies the non-linear outputs of the temperature sensors to the 0 to 10 V range and sends these signals to the A616TD where they are A/D converted, linearized and output as detected temperature values.

An example characteristic showing the relationship between the temperature sensor input values and the detected temperature values is shown in Fig. 3.1.

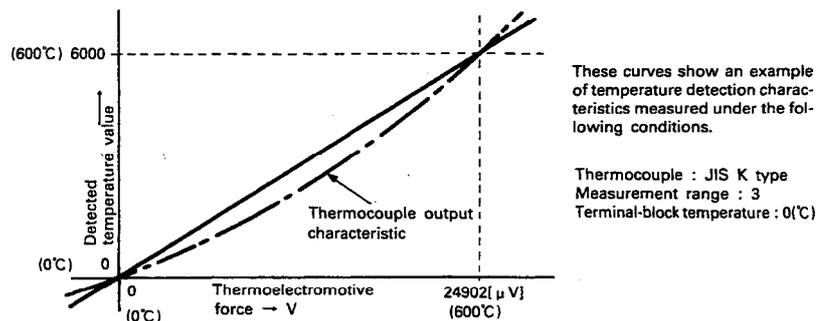

Fig. 3.1 Temperature Detection Characteristics

###### (2) Digital output characteristics

The temperatures representing digital outputs of 0 and 4000, respectively, are set in the buffer memory by the sequence program and are then used to output the appropriate digital values corresponding to each detected temperature in the temperature detection characteristic. An example characteristic showing the relationship between the detected temperature values and digital output values is shown in Fig. 3.2.

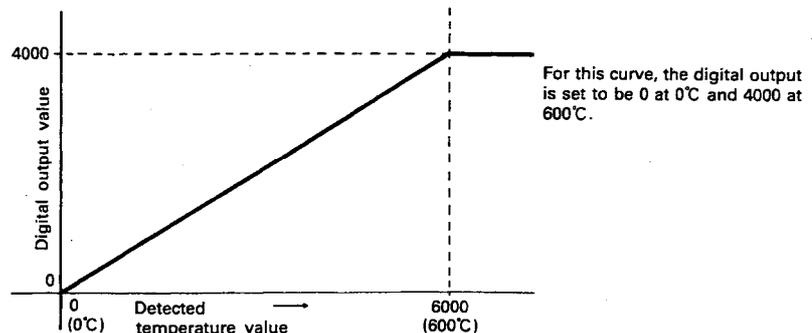

Fig. 3.2 Digital Output Characteristic

3.3.2 Conversion speed

The conversion speed of an A616TD and A60MXT combination is 50 milliseconds per channel.

The sequential conversion method used, whereby the processing for one channel is completed before processing is started for the next channel, gives a total sampling period of 50ms X the number of channels sampled. However, the sampling period can be decreased using the method described below.

Specify channel 0 of all A60MXT modules connected to the A616TD sequentially by (CONNECT NO.). After the input voltage has stabilized, A/D conversion is carried out for channel 0 of all A60MXT modules, in sequence starting from the module with CONNECT NO. 0. After A/D conversion is complete for channel 0 of all modules, the process is repeated for channel 1 of the modules in CONNECT NO. sequence, and so on, until A/D conversion has been completed for all channels.

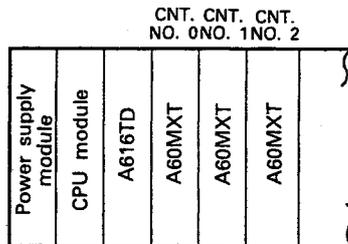

This method brings large reductions in channel selection time and A/D conversion time. This method effectively results in parallel processing carried out simultaneously for the same channel number of each A60MXT module.

- (1) Using this method, the sampling period is determined by multiplying the number of conversion channels for the module with the maximum number of conversion channels enabled by 50 milliseconds.

That is,

$$\text{Sampling period} = \text{no. of conversion channels enabled} \times 50\text{ms}$$

Example

- 9 channels are enabled for A/D conversion for A60MXT CONNECT NO. 0.
- 8 channels are enabled for A/D conversion for A60MXT CONNECT NO. 1.
- 5 channels are enabled for A/D conversion for A60MXT CONNECT NO. 2.

The module with A/D conversion enabled for the highest number of channels is the A60MXT CONNECT NO. 0 module with nine channels enabled.

$$\text{Sampling period} = 50\text{ms} \times 9 = 450\text{ms}$$

- (2) The processing timing for the example in (1) above is shown below.

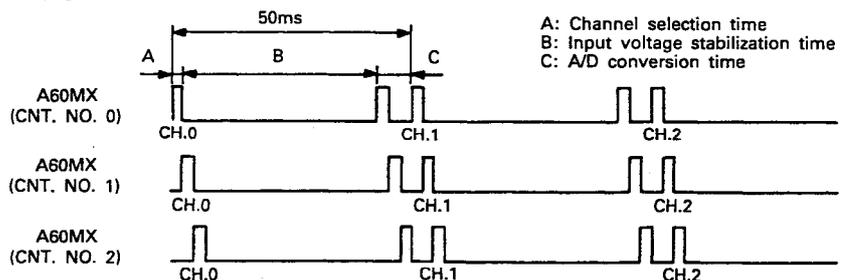

Fig. 3.3 Processing Timing

3.3.3 Life of the mercury-plunger relays

The life of the A60MXT and A60MXR mercury-plunger relays is 900 million cycles. The number of years of service life of the relays decreases as the sampling period decreases.

In order to increase the mercury-plunger relay service life, increase the sampling period by enabling conversion for all channels, including channels which are not being used.

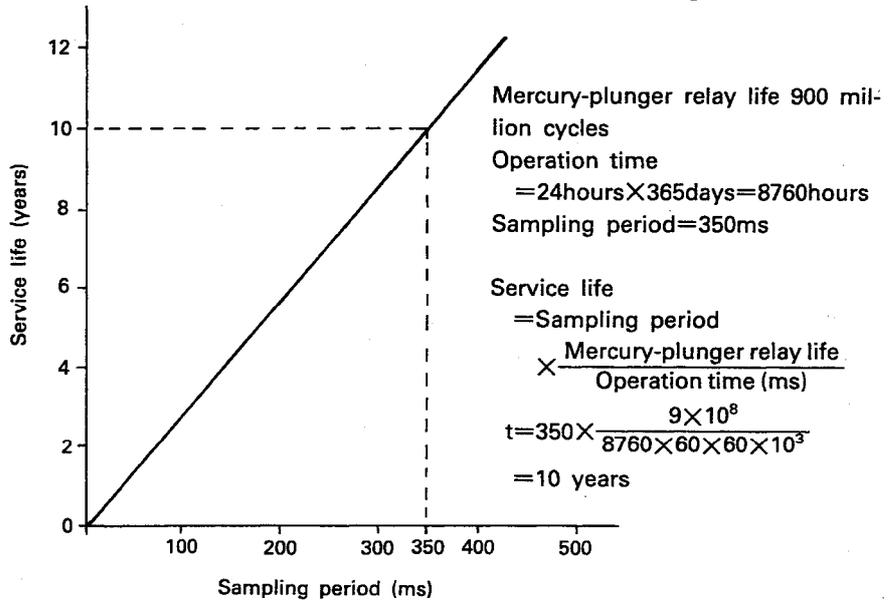

Fig. 3.4 Service Life of the Mercury-Plunger Relays

3.3.4 Overall accuracy

The full-scale accuracy of A616TD and A60MXT combination lies within the values shown in Table 3.2. However, the accuracy ( $\pm 0.5^\circ\text{C}$ ) of the thermoresistor Pt100, has to be added over the entire measurement temperature range.

Example

When measurement range 2 is selected while using a JIS K type thermocouple, the detected temperatures corresponding to temperatures of  $0^\circ\text{C}$ ,  $250^\circ\text{C}$  and  $500^\circ\text{C}$ , respectively, lie within the following ranges.

- Accuracy of the A616TD and A60MXT combination :  $500 \times 0.003 = \pm 1.5^\circ\text{C}$  (from Table 3.2)
- Overall accuracy upper limit value incorporating thermoresistor accuracy :  $1.5 + 0.5 = 2^\circ\text{C}$
- Overall accuracy lower limit value incorporating thermoresistor accuracy :  $-1.5 - 0.5 = -2^\circ\text{C}$

The detected temperature ranges at each sampling temperature become as follows:

- Detected temperature ranges {  $0^\circ\text{C} : -2^\circ\text{C} \text{ to } 2^\circ\text{C}$
- {  $250^\circ\text{C} : 248^\circ\text{C} \text{ to } 250^\circ\text{C}$
- {  $500^\circ\text{C} : 498^\circ\text{C} \text{ to } 502^\circ\text{C}$

3.3.5 Discontinuity detection function

This function is provided to detect electrical discontinuities in thermocouples and compensating leads connected to the A60MXT.

If a break occurs in a thermocouple lead or a compensating lead, as shown in Fig. 3.5, the A60MXT internal discontinuity detection circuit outputs a voltage to the A616TD which is equivalent to an out-of-range detected temperature value. The A616TD detects the discontinuity from the out-of-range voltage and stores the value "1" for the appropriate channel in the discontinuity detection area of the buffer memory and turns on the discontinuity error signal. The discontinuity detection function can be enabled or disabled for each channel by setting the discontinuity detection switches and buffer memory discontinuity detection channels in buffer memory.

(Refer to Sections 4.5 and 5.4.3 for details.)

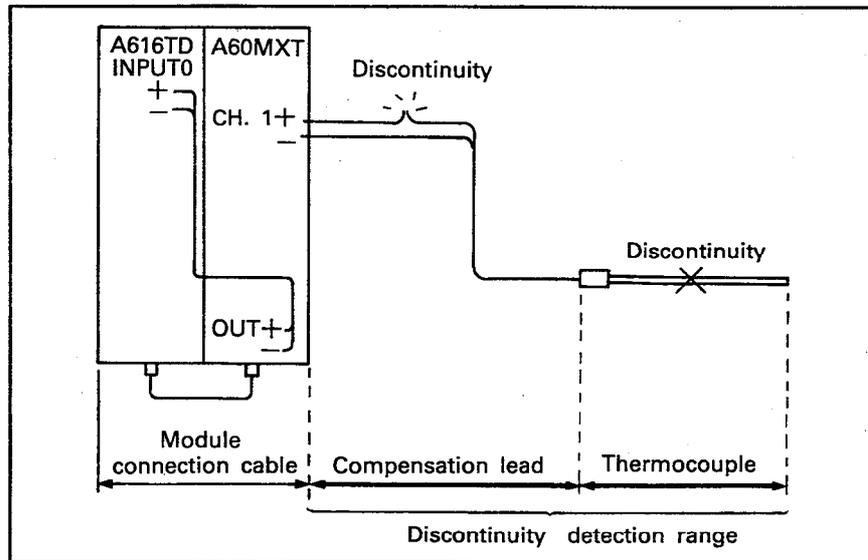

Fig. 3.5 Discontinuity Detection Range

3.3.6 Error compensation function

This function is provided to compensate for errors between actual temperatures and measured temperatures arising from differences in thermocouple accuracy, compensation lead lengths and location conditions of the thermocouples. Considerable errors can arise between actual temperatures and measured thermocouples for each thermocouple. Therefore, the error compensation function should always be used to eliminate for these errors. Error compensation can be carried out by setting a difference between the measured value of the reference temperature (for example, 0°C ice-water at 1 atmospheric pressure) and the actual reference temperature (0°C) to the buffer memory as an error compensation value. (Refer to Section 5.5 for details)

### 3.4 Analog/Digital Conversion

Channels are switched once each sampling period to sample the analog signals input from external sensors to the A60MXT, A60MX and A60MXR. The analog signals are converted to digital signals and stored in the buffer memory.

#### 3.4.1 Conversion characteristics

##### (1) A616TD I/O characteristics

The A616TD analog input range is fixed from 0 to +10V. The I/O characteristics are shown in Fig. 3.6.

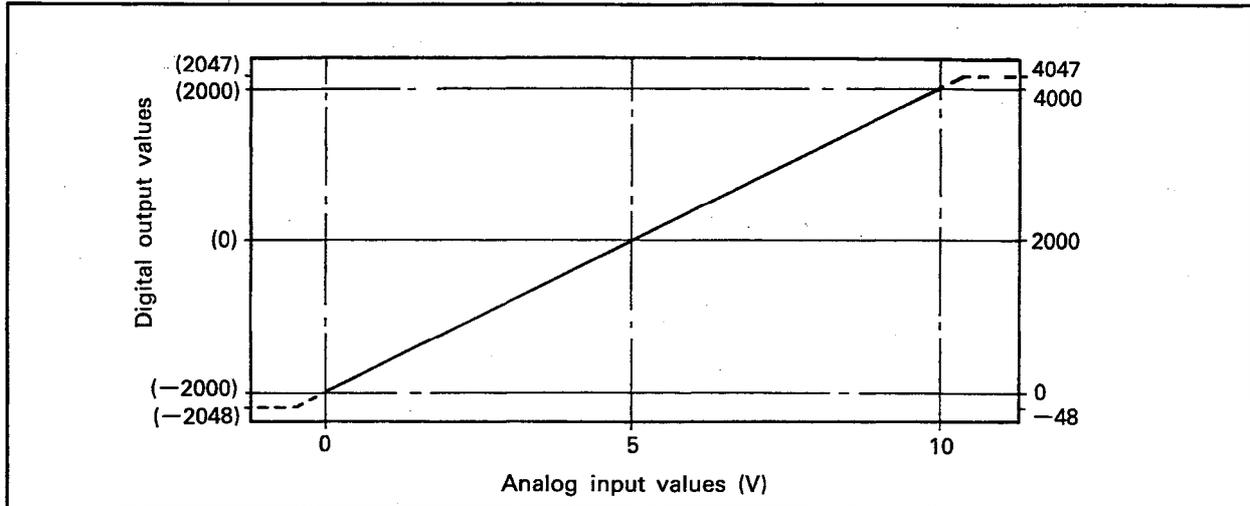

Fig. 3.6 A616TD I/O Characteristics

- 1) The digital output values can be selected from two output data formats: in the range  $-48$  to  $4047$  or  $-2048$  to  $2047$ . The output data format can be specified for each channel independently. (Refer to Section 6.2.1 (1) for details.)
- 2) The maximum resolution and overall accuracy values lie within the ranges shown in Table 3.4, when the input voltage is in the 0 to 10V range. However, the maximum resolution and overall accuracy values may not lie within these ranges if the input voltage exceeds the 0 to 10V range. Use of the sections of the A616TD I/O characteristic curve shown as a broken line in Fig. 3.6 should be avoided as the accuracy value may not comply with the table in these regions.
- 3) If an analog input is received which would cause the output value to exceed  $4047$  or  $-48$  when the output data format with the range  $-48$  to  $4047$  is specified, the output is held at  $4047$  or  $-48$ , respectively. Similarly, if an analog input is received which would cause the output value to exceed  $2047$  or  $-2048$  when the output data format with the range  $-2048$  to  $2047$  is specified, the output is held at  $2047$  or  $-2048$ , respectively.
- 4) Do not input a voltage exceeding  $\pm 15V$  as this may damage the module.

(2) A60MX, A60MXR and A60MXRN I/O Characteristic

Voltage input or current input can be selected for each A60MX and A60MXR channel by means of the analog input select switch. The offset/gain setting is carried out for blocks of 16 channels.

The A60MXRN allows voltage or current input to be selected per channel by the analog input select pin, and its offset/gain setting is carried out for 16 channels in block.

The predetermined I/O characteristics are selected according to the setting positions of the analog input select switch or analog input select pin and the offset/gain setting pins. The characteristics given in (a) assume that the analog input select switch or analog input select pin is set to voltage input, and those given in (b) assume that the switch or pin is set to current input.

(a) Voltage input characteristics

The characteristics given here assume that the analog input select switch or analog input select pin is set to voltage input.

A60MX, A60MXR and A60MXRN Output Voltage (V)	Analog Input Range (V)	Offset/Gain Setting Pin Position		I/O Characteristic
		S2 (S17*)	S1 (S18*)	
0 to 10	0 to +10	1 ☆	1 ☆	① in Fig. 3.7
	0 to +5	2	1	② in Fig. 3.7
	+1 to +5	3	2	③ in Fig. 3.7
	-10 to +10	4	3	④ in Fig. 3.7
	-5 to +5	1	3	⑤ in Fig. 3.7

\*For A60MXRN

☆Setting before shipment

Table 3.6 Analog Input Range and Offset/Gain Setting Pin Position

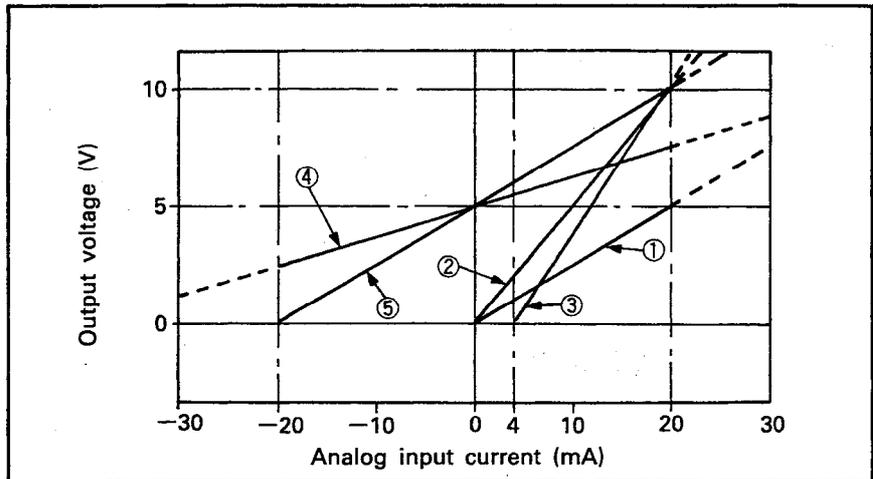

Fig. 3.8 A60MX, A60MXR and A60MXRN I/O Characteristics (for current input)

3.4.2 Conversion speed

The conversion speed when A60MX and/or A60MXR modules are connected to the A616TD is identical to when A60MXT modules are connected.

Refer to Section 3.3.2 for details of the conversion speed and processing timing.

3.4.3 Overall Accuracy

The graphs given below indicate the overall accuracies (with respect to the maximum value) of the A616TD, A60MX and A60MXR used individually and in combination. If the I/O characteristic is changed by the Offset/Gain setting pin, the overall accuracy remains unchanged and is kept within the range of the performance specifications.

4. PRE-OPERATION SETTINGS AND PROCEDURES

4.1 Pre-Operation Settings and Procedures

Make the following settings before carrying out temperature sensor input into an A616TD and A60MXT combination. Refer to Chapter 6 for the setting procedure for analog inputs.

## 4.2 Handling Instructions

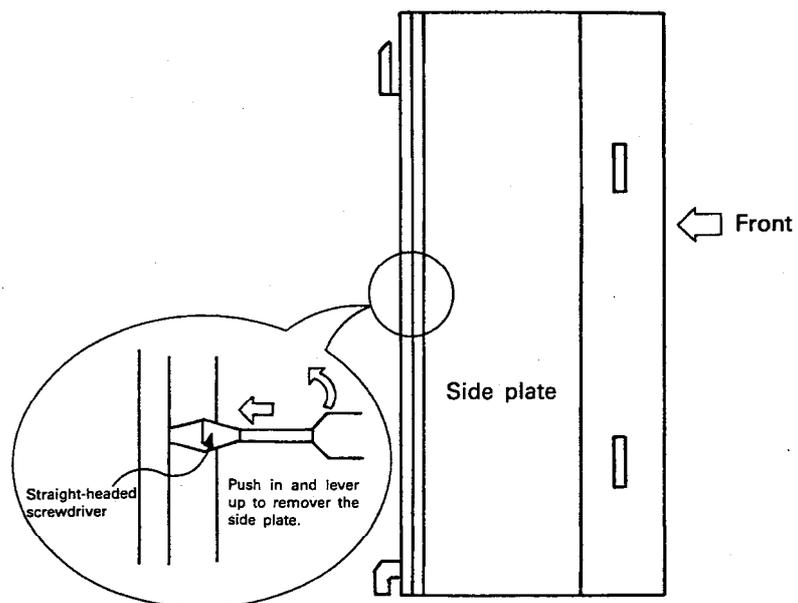

Consider the following important points when handling an A616TD or A60MXT module.

- (1) The A616TD and A60MXT cases and terminal blocks are made of plastic. Do not drop them or subject them to impact loads.
- (2) Do not remove printed circuit boards from the housing. There are no user-serviceable parts on the boards.
- (3) Ensure that no conductive debris can enter the module. If it does, make sure that it is removed. Guard particularly against wire offcuts.
- (4) Tighten terminal screws as specified below:

Screw	Tightening Torque Range N·cm
I/O terminal block terminal screws (M3)	39 to 59
I/O terminal block installation screws (M4)	78 to 118

- (5) To load the module onto the base, press the module against the base so that the hook is securely locked. To unload the module, push the catch on top of the module, and after the hook is disengaged from the base, pull the module toward you.

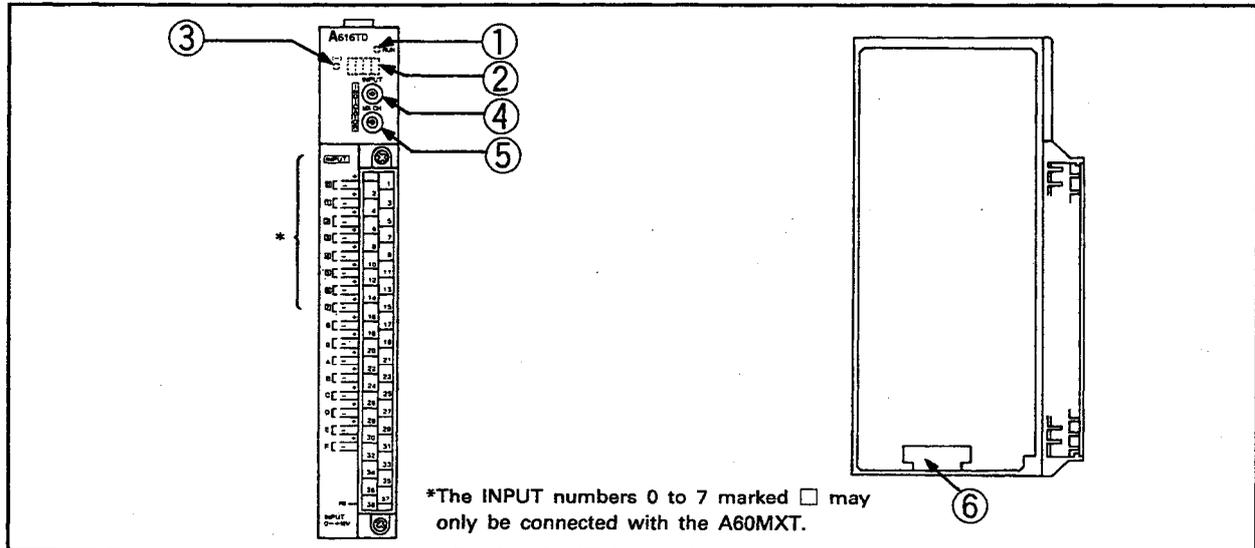

- (6) Refer to the diagram below when removing the left side plate of the unit.

## 4.3 Nomenclature

### 4.3.1 A616TD

Description and settings of A616TD parts.

No.	Name and Appearance	Description
①	<b>RUN LED</b>  	Indicates the operating status of the A616TD. On: Indicates that the A616TD is operating without fault. Flicker: Indicates that disable area write error, INPUT switch setting error, etc. has occurred. See Section 7.1. Off: Indicates 5V power-off, watch dog timer error or A60MXT/A60MX/A60MXR module fault.
②	<b>LED display</b>  	(1) Digital value indication <ul style="list-style-type: none"> <li>Indicates the digital value of the channel specified by the INPUT switch (④) and MX CH. switch (⑤) when Y10 is OFF.</li> <li>Indicates a digital value as a 4-digit decimal (in the range -48 to 4095 or -2048 to +2047).</li> <li>The minus indicator LED (③) is lit to indicate a negative digital value.</li> <li>Updates a digital value in 500ms increments.</li> </ul> (2) Detected temperature value indication <ul style="list-style-type: none"> <li>Indicates the detected temperature value of the channel specified by the INPUT switch (④) and MX CH. switch (⑤) when Y10 is ON.</li> <li>However, a digital value is indicated if the specified channel is not connected to an A60MXT module.</li> <li>Detected temperature values are displayed a 4-digit decimals. If the indicated temperature does not exceed 1000°C, e.g., 725.4°C.                             <div style="text-align: center;">  <p>Temperature is indicated to one decimal place.</p> </div>                             If the indicated temperature exceeds 1000°C, e.g., 1208.5°C.                             <div style="text-align: center;">  <p>No decimal places are indicated.</p> </div> </li></ul> <li>The minus-sign LED (③) lights to indicate a negative value.</li> (3) Error number indication <ul style="list-style-type: none"> <li>If an error has occurred, the corresponding error code is displayed as shown below:                             <div style="text-align: center;">  <p>Error code is indicated by the two least significant digits.</p> </div> </li> </ul>

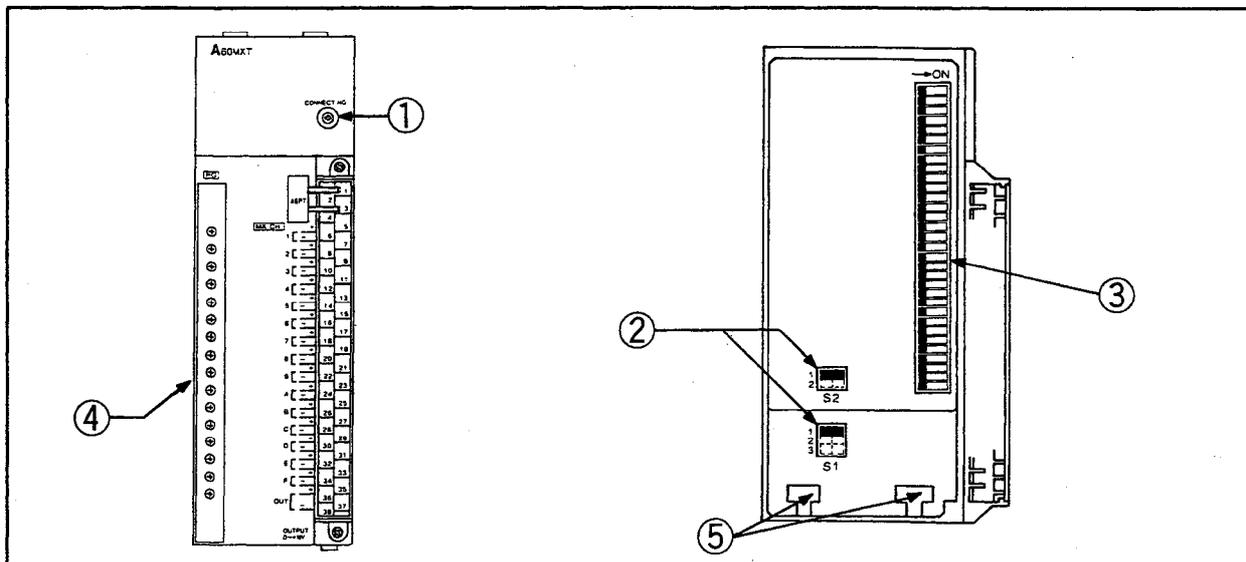

## 4. PRE-OPERATION SETTING AND PROCEDURES

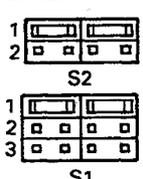

# MELSEC-A

No.	Name and Appearance	Description
③	Minus indicator LED 	Lit to indicate that the digital value is negative. Example: Digital value -520. 
④	INPUT switch 	Used to specify the channel of which the digital value or detected temperature value is to be displayed on the LED display. <ul style="list-style-type: none"> <li>• Use the MX CH. switch (⑤) to specify the channel of the module selected.</li> <li>• Setting range: 0 to 7</li> </ul>
⑤	MX CH. switch 	Used to specify the channel of which the digital value or detected temperature value is to be displayed on the LED display. <ul style="list-style-type: none"> <li>• The LED display (②) indicates the digital value or detected temperature value of the MX CH. switch-specified channel of the module selected by the INPUT switch.</li> <li>• Setting range: 0 to F</li> </ul>
⑥	Extension cable connector	For connecting the extension cable.

## 4.3.2 A60MXT

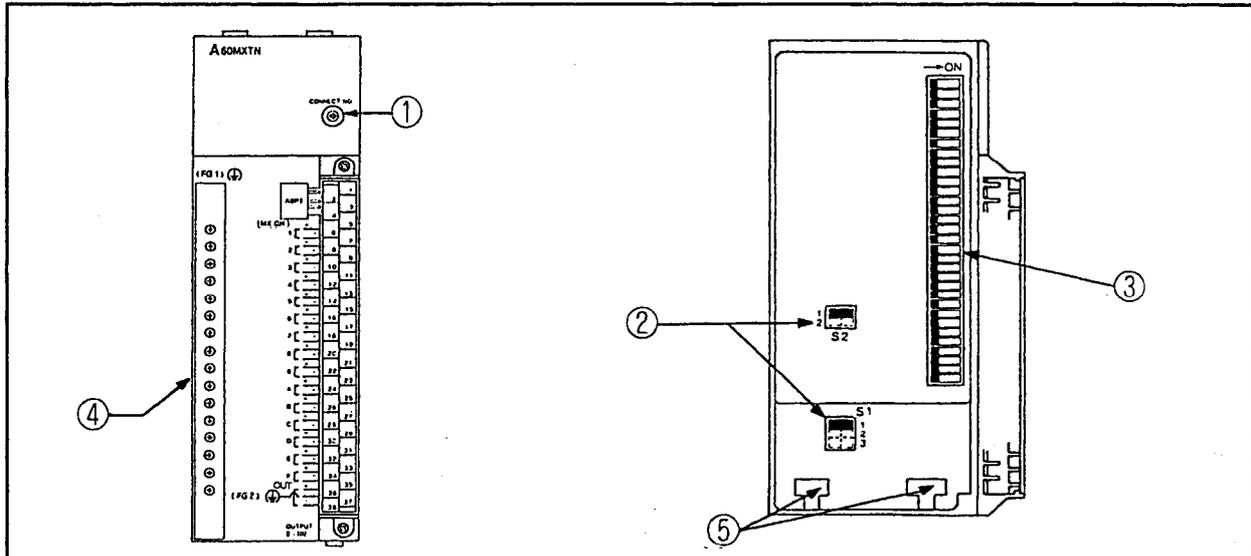

Description and settings of A60MXT parts.

No.	Name and Appearance	Description
①	<b>CONNECT NO. switch</b>  	A60MXT CONNECT NO. setting switch. • Used to specify to which input of the A616TD the A60MXT output is connected. • Setting range: 0 to 7
②	Used to set the temperature measurement range.  	Set the measurement range to suit to the temperature range to be measured and the type of thermocouple used. • Four setting ranges are available. Refer to Section 4.4 for details. • The temperature range is set to "4" when the module is shipped from the factory.
③	<b>Discontinuity detection switch</b>  	Used to enable the discontinuity detection function which detects electrical discontinuity in thermocouples or compensation leads. • Enable or disable the discontinuity detection function for each channel. • Refer to Section 4.5 for details of the discontinuity detection function. • The discontinuity detection function is disabled for all channels when the module is shipped from the factory.
④	<b>FG terminal block</b>	Connect the shields of the compensation leads to this terminal block.
⑤	<b>Extension cable connector</b>	For connecting the extension cable of the adjacent module when increasing a channel by loading the other A60MXT/A60MXTN/A60MX/A60MXR/A60MXRN next to the A60MXT. The extension cable may be connected to either of the two connectors.

## 4.3.3 A60MXTN

Description and settings of A60MXTN parts.

No.	Name and Appearance	Description
①	<p><b>CONNECT NO. switch</b></p>	<p>A60MXTN CONNECT NO. setting switch.</p> <ul style="list-style-type: none"> <li>• Used to specify to which input of the A616TD the A60MXTN output is connected.</li> <li>• Setting range: 0 to 7</li> </ul>
②	<p>Used to set the temperature measurement range.</p>	<p>Set the measurement range to suit to the temperature range to be measured and the type of thermocouple used.</p> <ul style="list-style-type: none"> <li>• Four setting ranges are available. Refer to Section 4.4 for details.</li> <li>• The temperature range is set to "4" when the module is shipped from the factory.</li> </ul>
③	<p><b>Discontinuity detection switch</b></p>	<p>Used to enable the discontinuity detection function which detects electrical discontinuity in thermocouples or compensation leads.</p> <ul style="list-style-type: none"> <li>• Enable or disable the discontinuity detection function for each channel.</li> <li>• Refer to Section 4.5 for details of the discontinuity detection function.</li> <li>• The discontinuity detection function is disabled for all channels when the module is shipped from the factory.</li> </ul>
④	<p><b>FG terminal block</b></p>	<p>Connect the shields of the compensation leads to this terminal block.</p>
⑤	<p><b>Extension cable connector</b></p>	<p>For connecting the extension cable of the adjacent module when increasing a channel by loading the other A60MXT/A60MXTN/A60MX/A60MXR/A60MXRN next to the A60MXTN.</p> <p>The extension cable may be connected to either of the two connectors.</p>

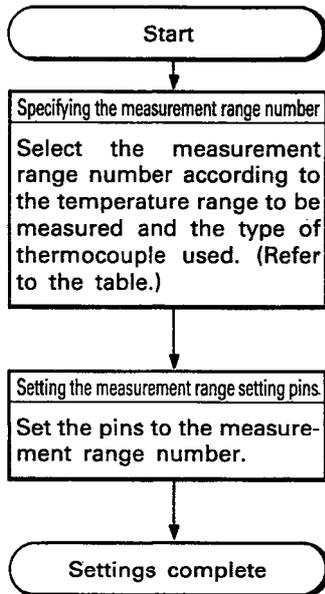

## 4. PRE-OPERATION SETTINGS AND PROCEDURES

# MELSEC-A

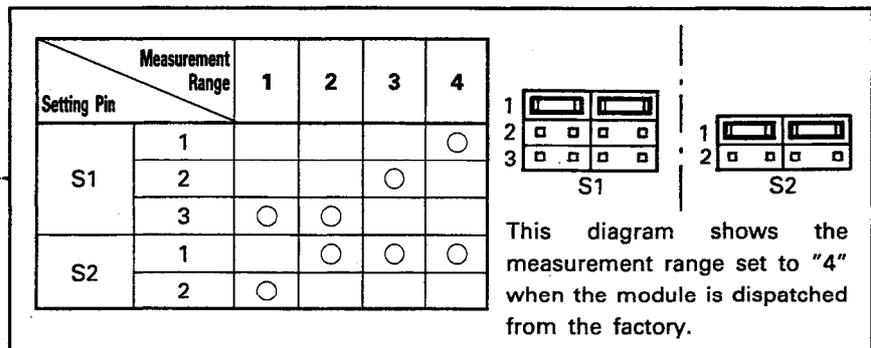

### 4.4 Setting the A60MXT Measurement Range

Follow the procedure below to set the measurement range to suit to the temperature range to be measured and the type of thermocouple used.

The measurement range is specified for a blocks of 15 channels; it cannot be specified for individual channels.

				Measurement Range No.				
JIS Standard	ANSI Standard	DIN Standard	BS Standard	Permitted Input Voltage Range (mV)	1	2	3	4
B	B	—	PtRh30 -PtRh6	Temperature measurement range (°C)	−12.5 to 12.5	0 to 25	0 to 50	0 to 100
				Accuracy (%)	—	±0.5	—	—
				Temperature drift (°C)	—	±0.013	—	—
R	R	—	PtRh13 -Pt	Temperature measurement range (°C)	0 to 1000	0 to 1700	0 to 1700	0 to 1700
				Accuracy (%)	—	±0.4	—	—
				Temperature drift (°C)	—	±0.011	—	—
S	S	PtRh -Pt	PtRh10 -Pt	Temperature measurement range (°C)	0 to 1200	0 to 1700	0 to 1700	0 to 1700
				Accuracy (%)	—	±0.4	—	—
				Temperature drift (°C)	—	±0.011	—	—
K	K	NiCr -Ni	NiCr -NiAl	Temperature measurement range (°C)	−200 to 250	0 to 500	0 to 1000	0 to 1300
				Accuracy (%)	±0.4	±0.3	±0.3	±0.5
				Temperature drift (°C)	±0.011	±0.01	±0.01	±0.013
E	E	—	NiCr -CuNi	Temperature measurement range (°C)	−200 to 150	0 to 300	0 to 600	0 to 1000
				Accuracy (%)	±0.4	±0.3	±0.3	±0.4
				Temperature drift (°C)	±0.011	±0.01	±0.01	±0.011
J	J	—	Fe- CuNi	Temperature measurement range (°C)	−200 to 200	0 to 400	0 to 800	0 to 1200
				Accuracy (%)	±0.4	±0.3	±0.3	±0.4
				Temperature drift (°C)	±0.011	±0.01	±0.01	±0.011
T	T	—	Cu- CuNi	Temperature measurement range (°C)	−200 to 200	0 to 400	0 to 400	0 to 400
				Accuracy (%)	±0.5	±0.3	—	—
				Temperature drift (°C)	±0.013	±0.01	—	—
—	—	Fe- CuNi	—	Temperature measurement range (°C)	−100 to 200	0 to 400	0 to 800	0 to 800
				Accuracy (%)	—	±0.3	±0.3	±0.5
				Temperature drift (°C)	—	±0.01	±0.01	±0.013
—	—	Cu- CuNi	—	Temperature measurement range (°C)	−100 to 200	0 to 400	0 to 600	0 to 800
				Accuracy (%)	—	±0.3	±0.4	—
				Temperature drift (°C)	—	±0.01	±0.11	—

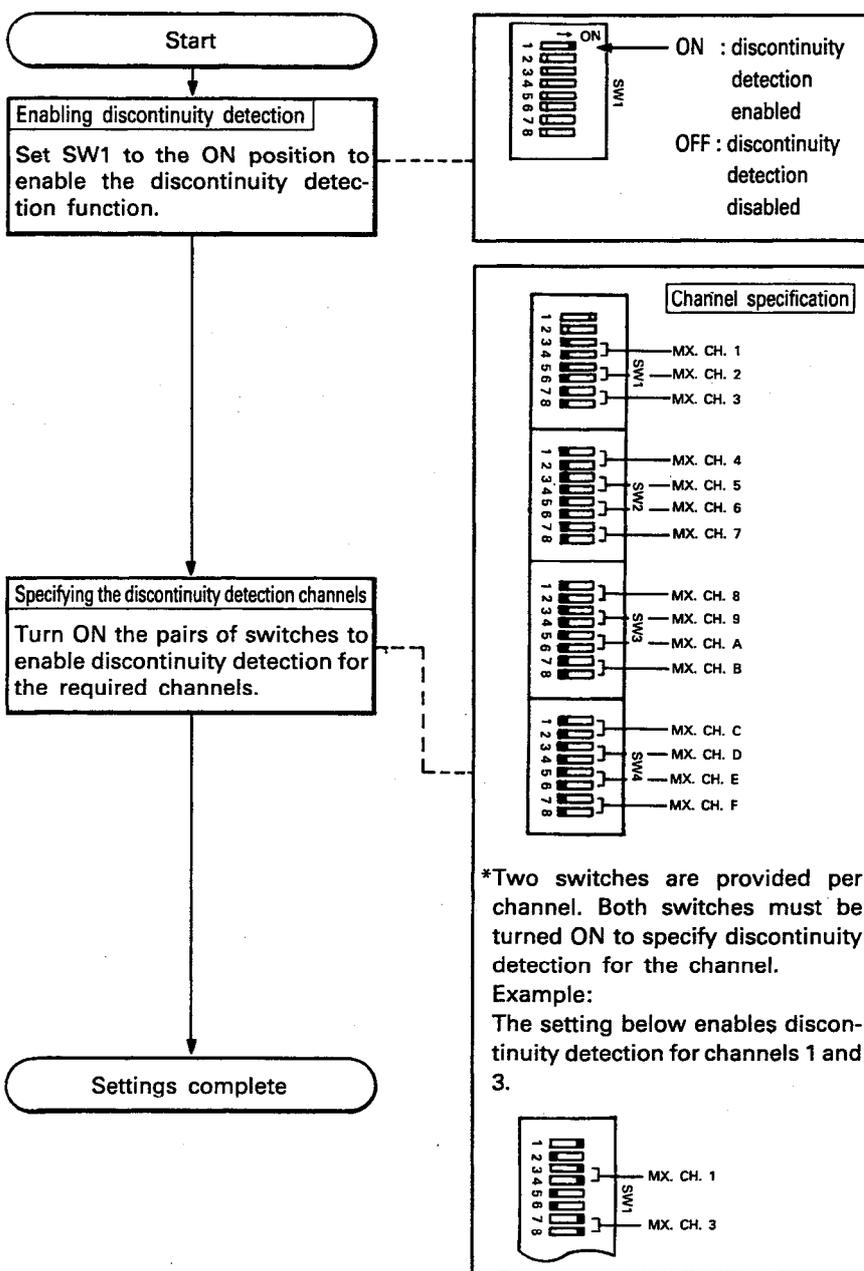

**POINT**

- (1) A setting error occurs and the following occur if the setting pins are set to any combination other than 1 to 4.
  - (a) Modules set outside the measurement range 1 to 4 : no processions  
Modules set within the measurement range 1 to 4 : processing continues
  - (b) Error number "04" is displayed on the A616TD LED display.
  - (c) Error code "04" is stored in the buffer memory address 1<sub>H</sub>.
  - (d) The A616TD RUN LED flashes. Refer to Section 5.12 for the method of resetting this error.

4.5 Setting the Discontinuity Detection Channels

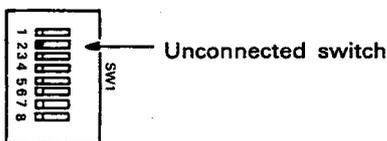

The channels for which thermocouples and compensation leads with electrical discontinuities are detected are specified with the discontinuity detection switches and by writing the channel numbers to buffer memory.

The procedure for setting the switches is described below.

REMARKS

The switch 2 of the discontinuity detection enable switch, SW1, is unconnected and may be set to the ON or OFF position.

### 4.6 Wiring Instructions

It is an essential condition for correct and reliable operation of systems incorporating the A616TD and A60MXT modules that wiring must be resistant to noise effects.

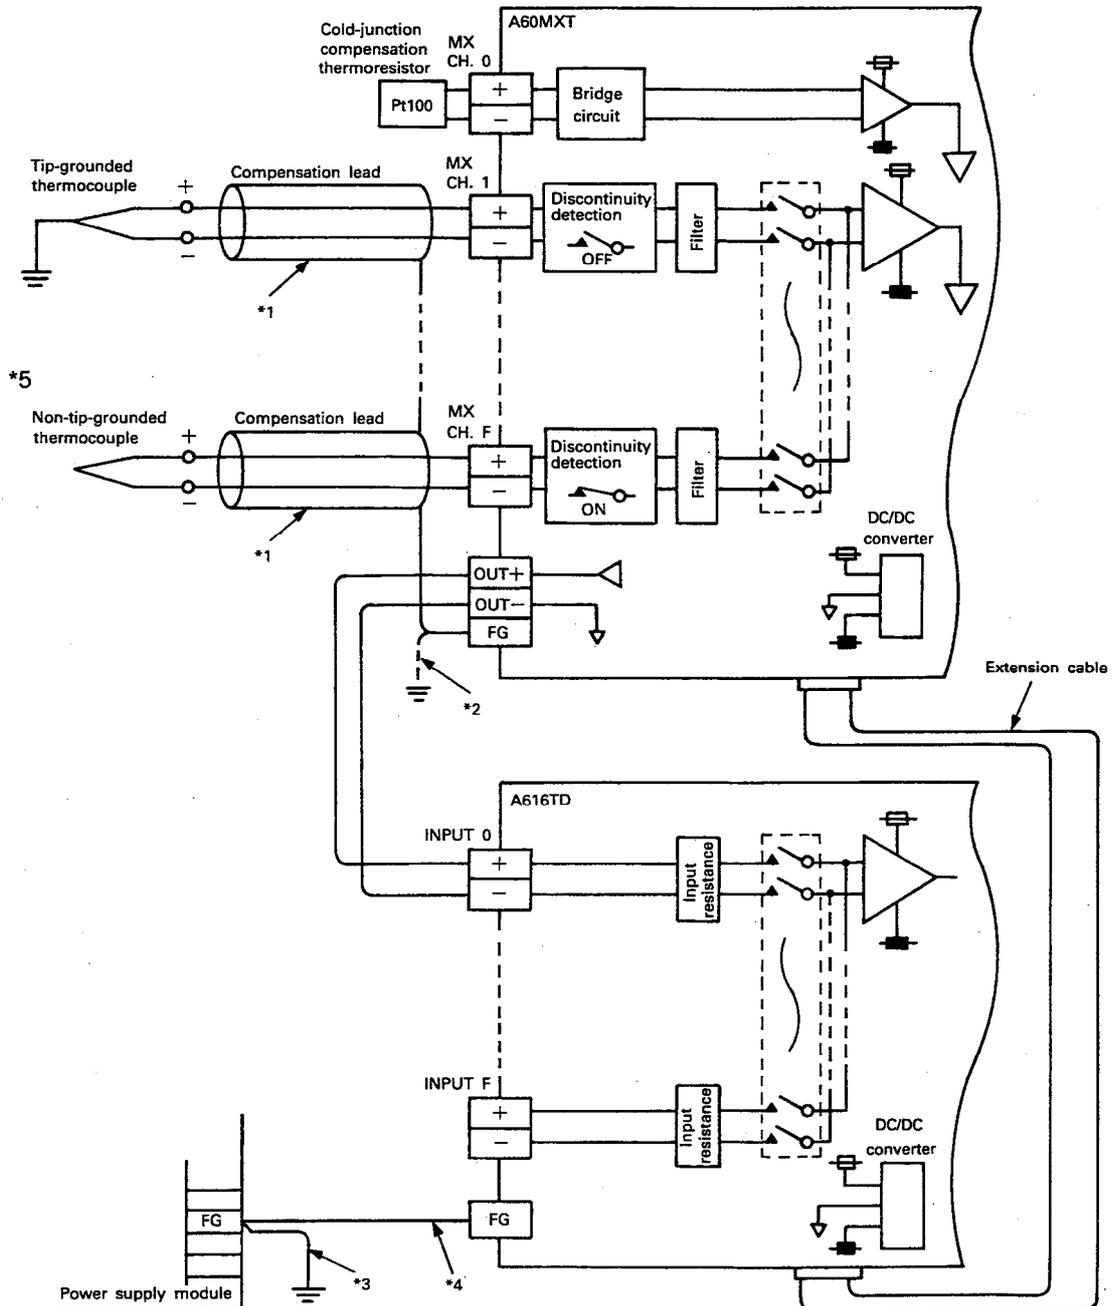

Note the following precautions when connecting A616TD and A60MXT wiring.

- (1) Use separate cables for AC control circuit wiring and A616TD or A60MXT external signal input wiring to eliminate induced surges from the control circuit wiring.
- (2) External wiring must be at least 10cm (4inches) away from main circuit and/or AC control circuit wiring.  
To reduce noise and surge induction effects, sufficiently separate external wiring from high-voltage wiring and any circuit that includes harmonics, such as inverter load main circuits.
- (3) Ground the shielding of all wires to a common ground point.

4.7 Wiring Examples

(1) Example of wiring carried out when A60MXT is connected to A616TD

Wiring example for thermocouple input to A616TD and A60MXT.

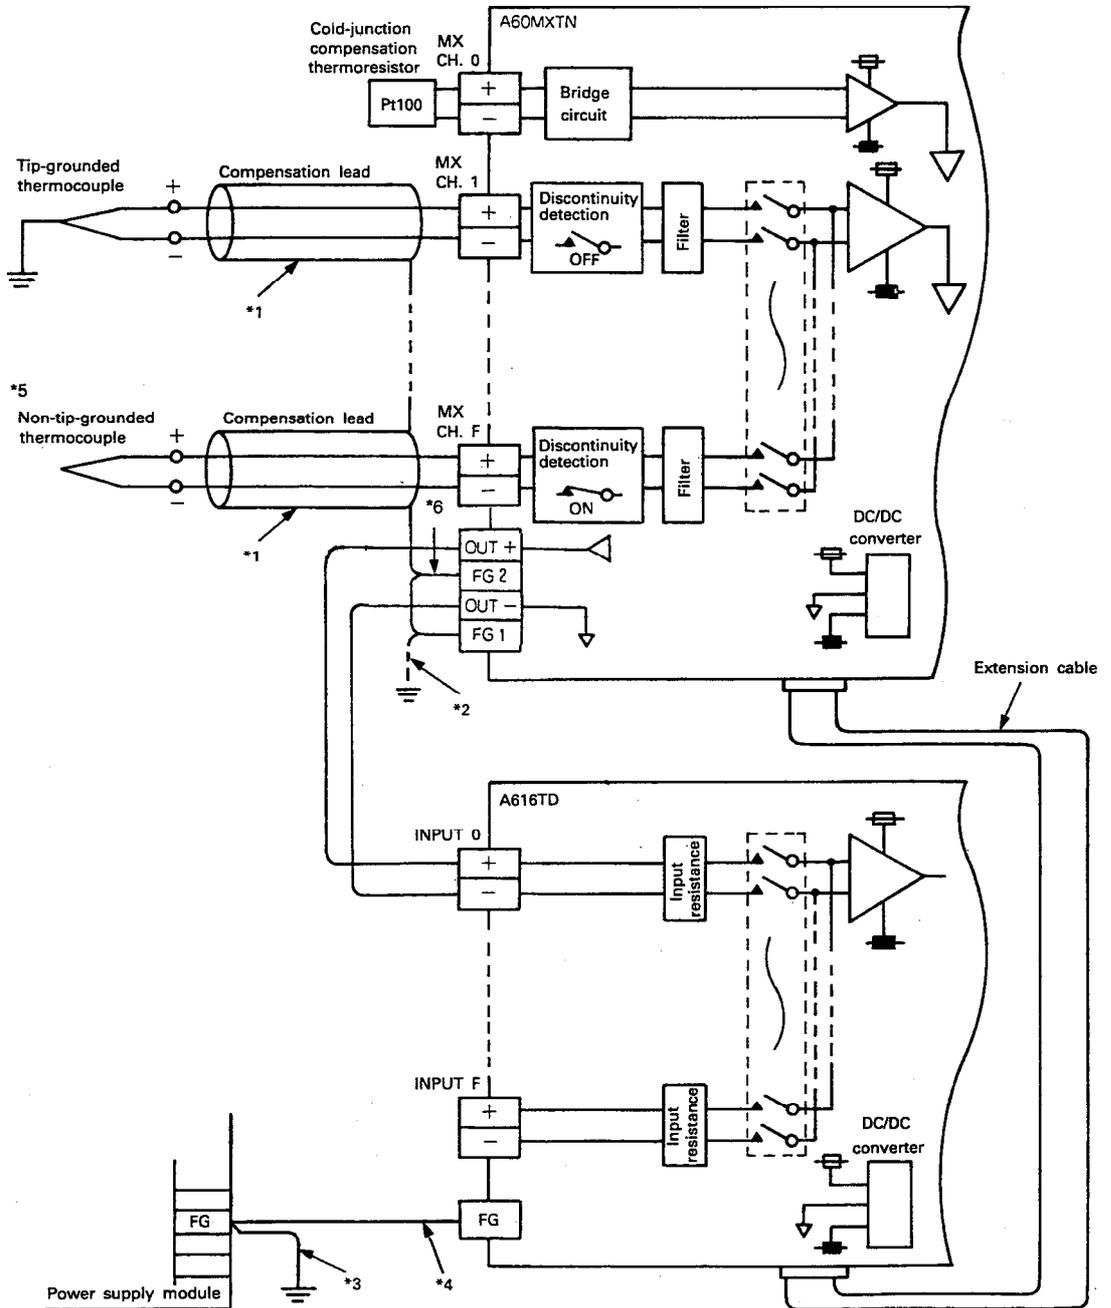

- \*1: Use only compensation leads.
- \*2: Always ground the compensation lead shields to the FG terminals.
- \*3: The FG terminals of the power supply module must be grounded.
- \*4: Always connect the A616TD FG terminal to the power supply module FG terminal.
- \*5: If noise exists on the object to be measured, use a non-grounding type where possible. When using a grounding type due to circumstances (e.g. response level), connect a 10 to 100  $\mu$  F capacitor to the input terminal in parallel.

**POINT**

Discontinuity detection may not be specified for channels to which tip-grounded thermocouples are connected, because the potential difference arising due to the difference in ground resistance between the thermocouple and discontinuity detection circuit ground points causes a current which gives rise to flow errors.

(2) Example of wiring carried out when A60MXTN is connected to A616TD  
 Wiring example for thermocouple input to A616TD and A60MXTN.

- \*1: Use only compensation leads.
- \*2: Always ground the compensation lead shields to the FG1 terminals.
- \*3: The FG terminals of the power supply module must be grounded.
- \*4: Always connect the A616TD FG terminal to the power supply module FG terminal.
- \*5: If noise exists on the object to be measured, use a non-grounding type where possible.  
 When using a grounding type due to circumstances (e.g. response level), connect a 10 to 100  $\mu$  F capacitor to the input terminal in parallel.
- \*6: Always ground the FG2 terminal of the A60MXTN.

**POINT**

Discontinuity detection may not be specified for channels to which tip-grounded thermocouples are connected, because the potential difference arising due to the difference in ground resistance between the thermocouple and discontinuity detection circuit ground points causes a current which gives rise to flow errors.

5. PROGRAMMING

5.1 Programmable Controller CPU I/O List

The A616TD uses 32 input and 32 output points for communication of data with the PLC CPU. I/O signal assignment and functions are as follows. Device X indicates an input signal from the A616TD to the PLC CPU and device Y an output signal from the PLC CPU to the A616TD. I/O numbers used in this manual assume that the A616TD is located at slot 0 of the main base.

Signal Direction:A616TD to PLC CPU		Signal Direction:PLC CPU to A616TD	
Device no.	Signal name	Device no.	Signal name
X0	Watch-dog time error (detected by A616TD)	Y0 to YC	Restricted for system use. Not available for user.
X1	A/D conversion ready		
X2	Error flag		
X3	Discontinuity error detected		
X4	Digital output value out-of-range		
X5	Temperature output value out-of-range	YD to YF	[RFRP], [RTOP] instruction interlock signal when A616TD is used in a remote I/O station.
X6 to X1C	Not used	Y10	Detected temperature value LED display request signal.
		Y11 to Y1F	Restricted for system use. Not available for user.
X1D to X1F	[RFRP], [RTOP] instruction interlock signal when A616TD is used in a remote I/O station.		

Table 5.1 Input and Output Signals

**IMPORTANT**

Device numbers Y0 to YC and Y11 to Y1F shown in Table 5.1 are reserved for system use and must not be turned on or off by a sequence program. Performance of the A616TD cannot be guaranteed if these device numbers are manipulated by a program. Y0 to Y1F, corresponding to X0 to X1F, cannot be used as external relays.

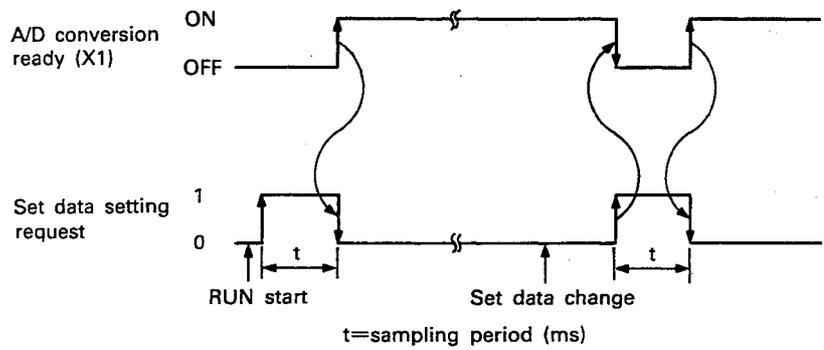

(1) Watch dog timer (X0)

On indicates that the A616TD has self-detected a watch dog timer error and stops the A/D conversion of the A616TD. The watch dog timer error indicates an A616TD hardware fault.

(2) A/D conversion ready (X1)

Switched on when the set data is made valid by writing "1" to the set data setting request area of the buffer memory with the sequence program.

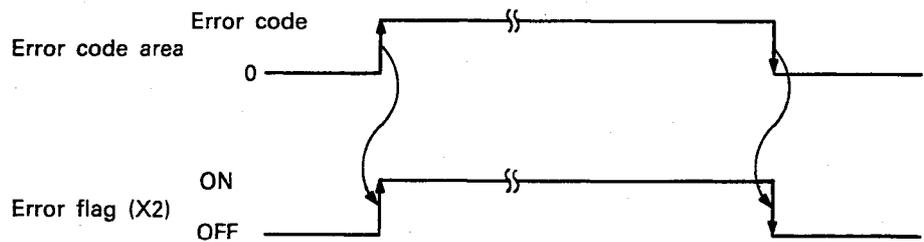

Switched off by writing "1" again to the set data setting request area during A/C conversion and switched on again when A/D conversion is ready after data check.

(3) Error flag (X2)

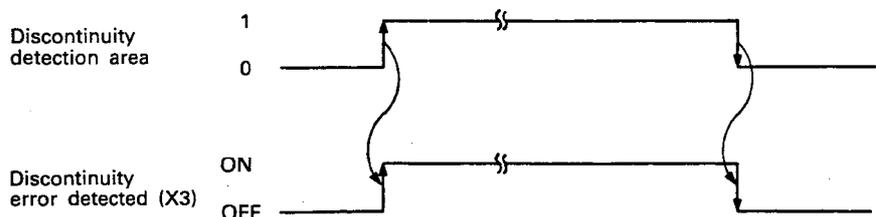

On indicates that an error other than the watch dog timer error has occurred in the A616TD and the corresponding error code has been stored to the error code area.

Switched off by writing "0" to the error code area by the sequence program.

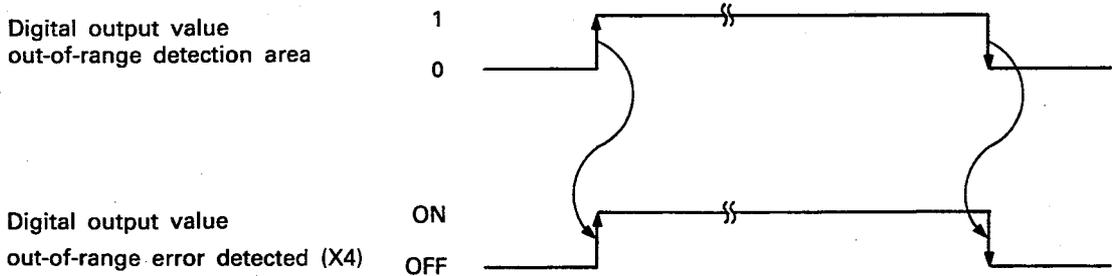

(4) Discontinuity error detected (X3)

This signal is turned on if a single "1" is set in the buffer memory discontinuity detection area. The signal is turned off by writing "0" to the discontinuity detection area with the sequence program.

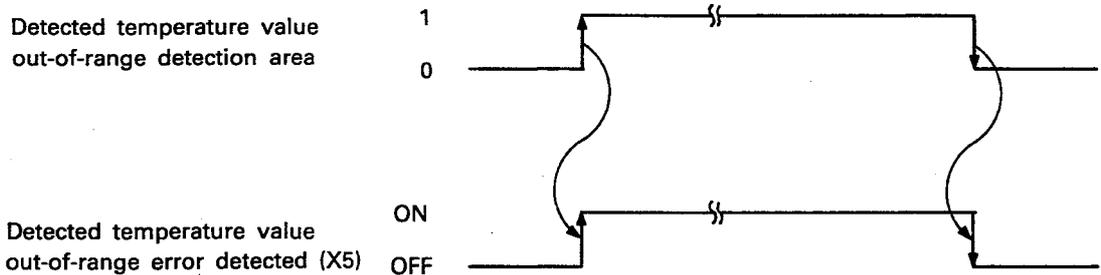

(5) Digital output value out-of-range (X4)

This signal is turned on if a single "1" is set in the buffer memory digital output value out-of-range detection area. The signal is turned off by writing "0" to the digital output value out-of-range detection area with the sequence program.

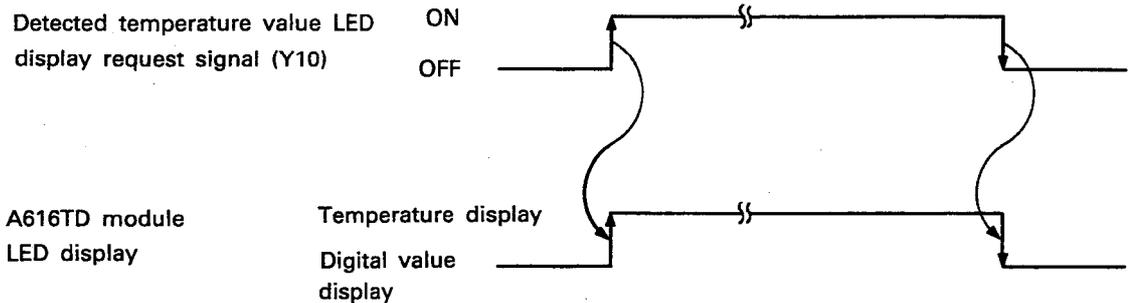

(6) Detected temperature output value out-of-range (X5)

This signal is turned on if a single "1" is set in the buffer memory detected temperature value out-of-range detection area. The signal is turned off by writing "0" to the detected temperature value out-of-range detection area with the sequence program.

(7) Detected temperature value LED display request signal (Y10)

When the detected temperature value LED display request signal is turned ON, the detected temperature of the channel specified by the A616TD INPUT switch and MX CH. switch is displayed on the LED display.

5.2 Buffer Memory

The A616TD has a buffer memory for communication of data with the programmable controller (PLC) CPU. The buffer memory has no battery back-up.

5.2.1 Buffer memory assignment

The buffer memory addresses are assigned as shown in the table below.

Address (Hexadecimal)		Write condition	Reference
0H	Data format selection	Random	Section 6.2.1
1H	Error code storage	Random	Section 5.12, Section 6.2.4
2H	Faulty A60MX <input type="checkbox"/> CONNECT NO. storage	Random	Section 5.11, Section 6.2.3
3H	Thermocouple-type setting error channel number storage	Random	Section 5.4.1
4H	Current sampling period storage	Write protected	Section 5.10
to	Not used	Write protected	—
FH	Conversion enable/ disable designation	Random	Section 5.4.2, Section 6.2.1
10H to 17H			
18H	Set data setting request	Random	Section 5.4.5, Section 6.2.1
to	Not used	Write protected	—
20H to 27H	Discontinuity detection enable/disable designation	Random	Section 5.4.3
to	Not used	Write protected	—
30H to 3FH	Temperature settings corresponding to digital output values	Random	Section 5.4.4
40H to 47H	Discontinuity detection channel number storage	Random	Section 5.9.1
to	Not used	Write protected	—
50H to 57H	Digital output value out-of-range channel number storage	Random	Section 5.9.2
to	Not used	Write protected	—
60H to 67H	Temperature output value out-of-range channel number storage	Random	Section 5.9.3
to	Not used	Write protected	—
70H to 7FH	Input channel digital output value storage	Write protected	Section 6.2.2
80H to FFH	Error compensation settings	Random	Section 5.5
100H to 17FH	Thermocouple-type settings	Random	Section 5.4.1
180H to 1FFH	MX CH. channel digital output value storage	Write protected	Section 5.6, Section 6.2.2
200H to 27FH	MX CH. channel detected temperature value storage	Write protected	Section 5.7

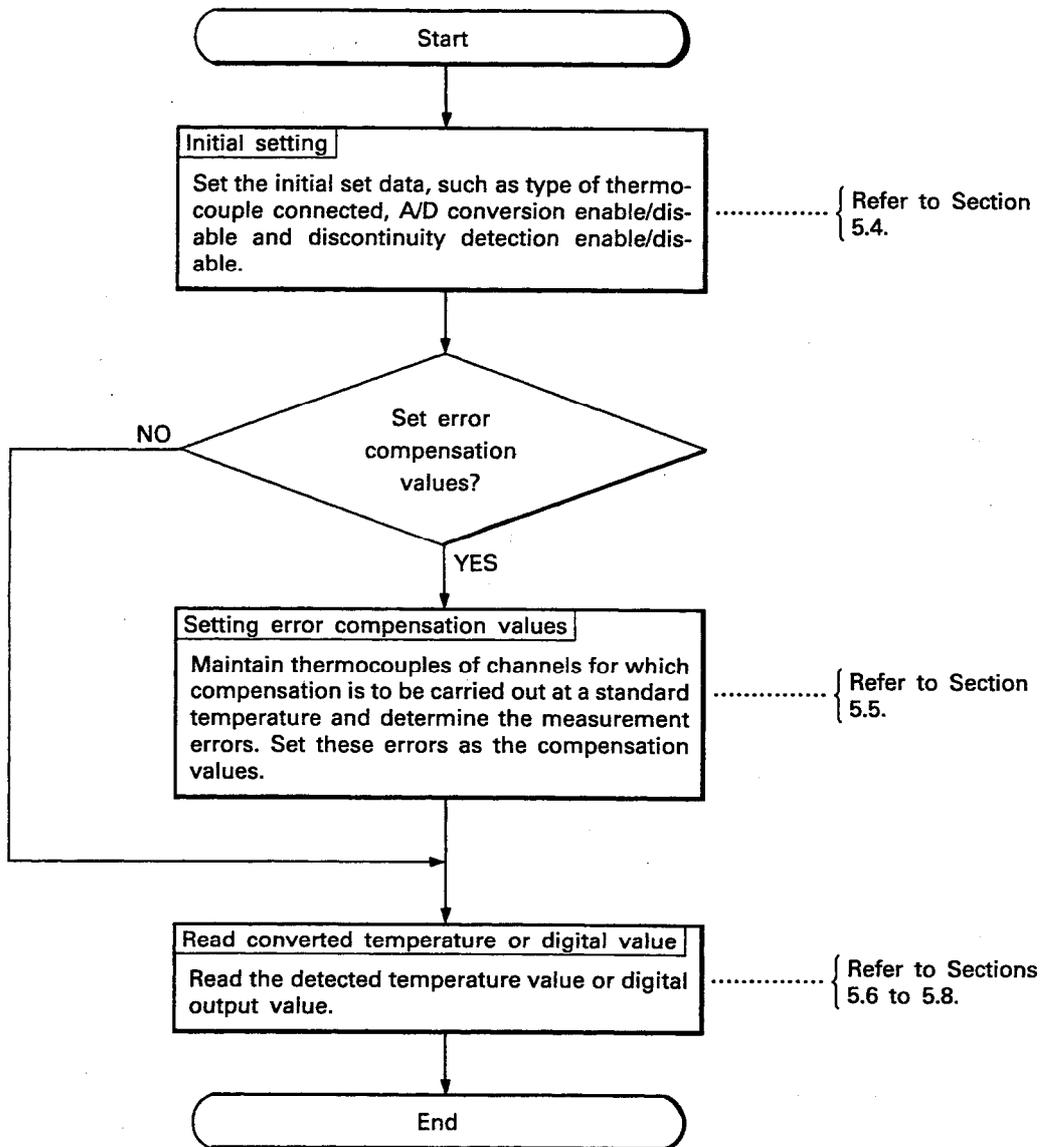

Random data read permitted from the above memory areas at all times.

**IMPORTANT**

The write-protected areas of the buffer memory are read-only areas for the sequence program. It is important that the sequence program does not write to these areas. If an attempt is made to write to a write-protected buffer memory area, error number 10 is displayed and the RUN LED flashes.

5.3 Programming Procedure

An A616TD temperature/digital conversion program is written according to the following procedure:

**POINT**

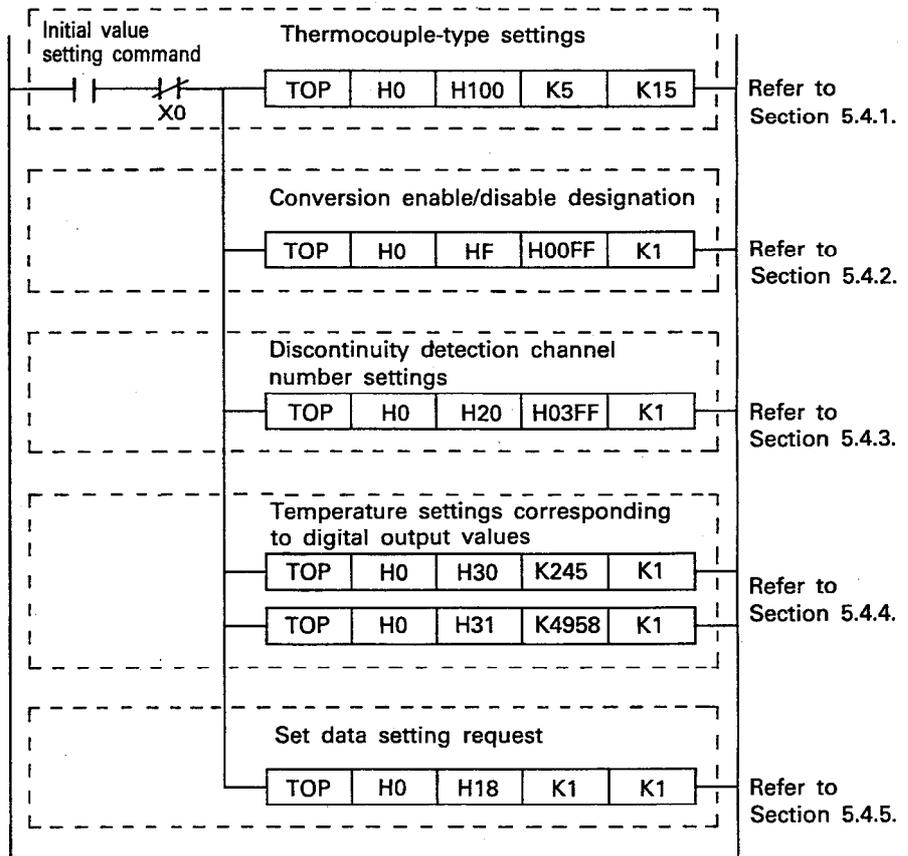

During each of the processes of the special function module, access from the PLC CPU will have priority. Accordingly, if frequent access to the buffer memory of the special function module made from the PLC CPU, it will not only extend the scan time of the PLC CPU, delays in each of the processes of the special function module will occur. Only use the FROM/TO and other such commands to access the buffer memory from the PLC CPU when necessary.

5.4 Initial Setting

The initial setting program shown below must be included before any program to read detected temperature or digital output values.

Conditions: When one A60MXT whose CNT. No. is set to 0 is connected to the A616TD, and thermocouples are connected to 15 channels of the A60MXT channels (MX CH. 1 to F).

Used thermocouple	JIS B type (set value = 5)	
Conversion enable/disable setting	A616TD	INPUT 0 to 7 = Conversion enable INPUT 8 to F = Conversion disable
	A60MXT	MX CH 0 to F = Conversion enable
Discontinuity detection channel setting	MX CH 0 to 9 = Discontinuity detected MX CH A to F = Discontinuity not detected	
Temperature settings corresponding to digital output values	24.5 °C when digital output value = 0 (Set value = 245) 495.8 °C when digital output value = 4000 (Set value = 4958)	

Always execute the set data setting request after setting the initial set data in the buffer memory. The previously set data becomes valid and A/D conversion is carried out when this set data setting request instruction is executed.

5.4.1 Setting the thermocouple types

Determine the setting value (0 to 8) appropriate for the type of thermocouple connected to each channel from Table 5.2 and write the values for each channel to the buffer memory addresses 100<sub>H</sub> to 17F<sub>H</sub>.

- (1) The setting value for each type of thermocouple is shown in the table below.

Setting Value Standard	Type of Thermocouple									
	0	1	2	3	4	5	6	7	8	
JIS	K	J	E	R	T	B	S	—	—	
ANSI	K	J	E	R	T	B	S	—	—	
BS	NiCr -NiAl	Fe -CuNi	NiCr -CuNi	PtRh13 -Pt	Cu -CuNi	PtRh30 -RtRh6	PtRh10 -Pt	—	—	
DIN	NiCr -Ni	—	—	—	—	—	PtRh -Pt	Fe -CuNi	Cu -CuNi	

Table 5.2 A60MXT Application Thermocouple List

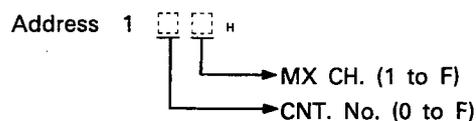

- (2) The setting area of buffer memory addresses 100<sub>H</sub> to 17F<sub>H</sub> is configured as follows.

Address

100 <sub>H</sub>	CNT. No. 0	MX CH. 0	No setting required.
101 <sub>H</sub>		MX CH. 1	Thermocouple-type setting area
102 <sub>H</sub>		MX CH. 2	Thermocouple-type setting area
to		⋮	
10F <sub>H</sub>		MX CH. F	Thermocouple-type setting area
110 <sub>H</sub>	CNT. No. 1	MX CH. 0	No setting required.
111 <sub>H</sub>		MX CH. 1	Thermocouple-type setting area
112 <sub>H</sub>		MX CH. 2	Thermocouple-type setting area
to		⋮	
11F <sub>H</sub>		MX CH. F	Thermocouple-type setting area
to	⋮		
170 <sub>H</sub>	CNT. No. 7	MX CH. 0	No setting required.
171 <sub>H</sub>		MX CH. 1	Thermocouple-type setting area
172 <sub>H</sub>		MX CH. 2	Thermocouple-type setting area
to		⋮	
17F <sub>H</sub>		MX CH. F	Thermocouple-type setting area

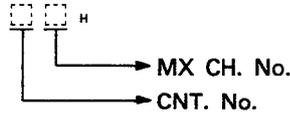

CNT NO. refers to CONNECT number.

The relationship between the area addresses and channel numbers is as follows:

- (3) The default value of "0" is written to all channels when the power supply is turned on or the PLC CPU reset.

- (4) A setting error occurs if a value outside of the range 0 to 8 is written to the setting area. The error code 70 is written to the buffer memory address 1<sub>H</sub> and the channel number for which the setting error occurred is written to address 3<sub>H</sub> as a 2-digit hexadecimal value.

The channel number for which the setting error occurred remains stored in memory after the setting value is corrected within the range 0 to 8. Write "0" to the buffer memory address 1<sub>H</sub> with the sequence program to clear the detected data. (Refer to Section 5.12.)

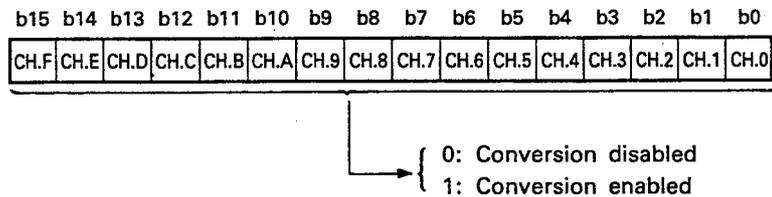

**POINT**

- (1) No settings can be made for MX CH. 0 for CNT NO. 0 to F as the cold-junction compensation thermoresistors (Pt100) are connected to these channels. Settings made for these channels are ignored.
- (2) A setting error occurs if a value outside of the range 0 to 8 is written to the setting area. In this case, the following occur:
  - a) The A616TD RUN LED flashes
  - b) The error code 70 is displayed on the A616TD LED display
  - c) Conversion is interrupted for the channel for which the out-of-range data was set.

5.4.2 Specifying A/D conversion enable/disable

Write "0" or "1", respectively, to the buffer memory addresses F<sub>H</sub> to 17<sub>H</sub> to disable or enable A/D conversion for each A616TD and A60MXT channel. Refer to Section 6.2.1 (1) if A60MX and a A60MXR are to be connected for a combination of temperature/digital conversion and analog/digital conversion.

- (1) Default values are written to address F<sub>H</sub> when the power supply is turned on or the PLC CPU reset to enable conversion for all channels. Values are written to the addresses 10<sub>H</sub> to 17<sub>H</sub> to enable conversion for all channels of CNT N. areas to which an A60MXT module is connected, and to disable conversion for all the CNT No. areas.
- (2) The 16-bit configuration of the memory area is shown below.

- (3) The setting area of buffer memory addresses F<sub>H</sub> to 17<sub>H</sub> is configured as follows.

Address

F <sub>H</sub>	A616TD INPUT 0 to F	Channel conversion enable/disable setting area
10 <sub>H</sub>	CNT. No. 0 MX CX. 0 to F	Channel conversion enable/disable setting area
11 <sub>H</sub>	CNT. No. 1 MX CX. 0 to F	Channel conversion enable/disable setting area
12 <sub>H</sub>	CNT. No. 2 MX CX. 0 to F	Channel conversion enable/disable setting area
13 <sub>H</sub>	CNT. No. 3 MX CX. 0 to F	Channel conversion enable/disable setting area
14 <sub>H</sub>	CNT. No. 4 MX CX. 0 to F	Channel conversion enable/disable setting area
15 <sub>H</sub>	CNT. No. 5 MX CX. 0 to F	Channel conversion enable/disable setting area
16 <sub>H</sub>	CNT. No. 6 MX CX. 0 to F	Channel conversion enable/disable setting area
17 <sub>H</sub>	CNT. No. 7 MX CX. 0 to F	Channel conversion enable/disable setting area

**POINT**

- (1) Channel 0 of the A60MXT is the reference temperature measurement channel. Therefore, if conversion is enabled for a single channel from CH.1 to CH.F, conversion is carried out regardless of the enable/disable setting for channel 0.
- (2) "0" (conversion disable) is automatically written to the CNT No. area for channels which are not connected with the A60MXT.
- (3) If conversion is enabled for channels which are not connected with the A60MXT, the setting is ignored.

5.4.3 Specifying the discontinuity detection channels

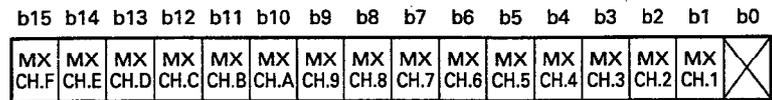

The discontinuity detection function is specified for the thermocouples connected to the A60MXT by setting the switches (as described in Section 4.5) and writing the values "0" or "1" to the buffer memory addresses 20<sub>H</sub> to 27<sub>H</sub>.

- (1) The default values written to the buffer memory addresses when the power supply is turned on or the PLC CPU reset, differ depending on the setting of the discontinuity detection enable switch, SW1.

ON : discontinuity detection enabled for all channels MX CH. 1 to F.

OFF : discontinuity detection disabled for all channels MX CH. 1 to F.

- (2) If discontinuity detection is to be enabled or disabled for all channels of the A60MXT, the default values are satisfactory, and no further settings are required.
- (3) However, if discontinuity detection is to be enabled for only some of the channels, these channels can be specified with the channel setting switches from switch 4 of SW1 to switch 8 of SW4. Turn the appropriate pair of switches for the channel ON to enable the discontinuity detection.
- (4) The 16-bit configuration of the memory area is shown below.

Flag "1" is ignored. ←  
 { 0: Discontinuity detection disabled  
 1: Discontinuity detection enabled

- (5) The setting area of buffer memory addresses 20<sub>H</sub> to 27<sub>H</sub> is configured as follows.

Address	Content
20 <sub>H</sub>	CNT. No.0 MX CH. 1 to F Discontinuity detection enable/disable setting area
21 <sub>H</sub>	CNT. No.1 MX CH. 1 to F Discontinuity detection enable/disable setting area
22 <sub>H</sub>	CNT. No.2 MX CH. 1 to F Discontinuity detection enable/disable setting area
23 <sub>H</sub>	CNT. No.3 MX CH. 1 to F Discontinuity detection enable/disable setting area
24 <sub>H</sub>	CNT. No.4 MX CH. 1 to F Discontinuity detection enable/disable setting area
25 <sub>H</sub>	CNT. No.5 MX CH. 1 to F Discontinuity detection enable/disable setting area
26 <sub>H</sub>	CNT. No.6 MX CH. 1 to F Discontinuity detection enable/disable setting area
27 <sub>H</sub>	CNT. No.7 MX CH. 1 to F Discontinuity detection enable/disable setting area

**POINT**

The following occur if the contents of the buffer memory differ from the switch settings:  
**Buffer memory enabled, switch setting disabled: discontinuity not detected.**  
**Buffer memory disabled, switch setting enabled: errors in detected temperature values.**

5.4.4 Setting the temperatures corresponding to digital output values

Determine the measured temperatures for each channel corresponding to a digital output value of 0 and 4000, respectively, and write the values to the buffer memory addresses 30<sub>H</sub> to 3F<sub>H</sub>.

- (1) Default temperature values for a digital output of 0 and 4000, which depend on the measurement range, are written to the buffer memory when the power supply is turned on or the PLC CPU reset, as shown in Table 5.3.

Measurement Range \ Digital Value	1	2	3	4
0	-2000 (×10 <sup>-1</sup> °C)	0 (×10 <sup>-1</sup> °C)	0 (×10 <sup>-1</sup> °C)	0 (×10 <sup>-1</sup> °C)
4000	3000 (×10 <sup>-1</sup> °C)	10000 (×10 <sup>-1</sup> °C)	10000 (×10 <sup>-1</sup> °C)	10000 (×10 <sup>-1</sup> °C)

Table 5.3 Temperature Settings Corresponding to Digital Output Values

- (2) Write the required setting temperatures to buffer memory addresses 30<sub>H</sub> to 3F<sub>H</sub> to set temperatures other than the default temperatures to correspond to digital output values of 0 and 4000.
- (3) The temperatures are input to the first decimal place, by using the setting values as follows:

$$\text{Setting value} = \text{Temperature value to the first decimal place} \times 10$$

Example

To set a temperature of 23.5°C, use a setting value of 23.5 × 10 = 235.

- (4) The setting area of buffer memory addresses 30<sub>H</sub> to 3F<sub>H</sub> is configured as follows.

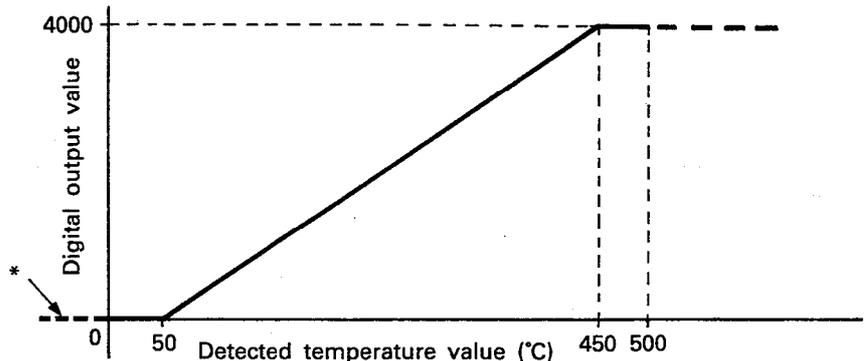

Address

30 <sub>H</sub>	INPUT 0	Temperature setting value (corresponding to a digital value of 0).
31 <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).
32 <sub>H</sub>	INPUT 1	Temperature setting value (corresponding to a digital value of 0).
33 <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).
34 <sub>H</sub>	INPUT 2	Temperature setting value (corresponding to a digital value of 0).
35 <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).
36 <sub>H</sub>	INPUT 3	Temperature setting value (corresponding to a digital value of 0).
37 <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).
38 <sub>H</sub>	INPUT 4	Temperature setting value (corresponding to a digital value of 0).
39 <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).
3A <sub>H</sub>	INPUT 5	Temperature setting value (corresponding to a digital value of 0).
3B <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).
3C <sub>H</sub>	INPUT 6	Temperature setting value (corresponding to a digital value of 0).
3D <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).
3E <sub>H</sub>	INPUT 7	Temperature setting value (corresponding to a digital value of 0).
3F <sub>H</sub>		Temperature setting value (corresponding to a digital value of 4000).

- (5) The settings of the temperatures which correspond to the digital outputs of 0 and 4000 determine the temperature/digital conversion characteristics.

Example

The temperature measurement range is 0 to 500°C for a JIS standard, K type thermocouple with the A60MXT measurement range set to "2". The temperature/digital conversion characteristic is as shown below if a temperature of 50°C is set to correspond to a digital output value of 0 and a temperature of 450°C is set to correspond to a digital output value of 4000.

Avoid operation in the areas indicated with dotted lines as they do not meet accuracy specifications.

- (6) When temperatures set to correspond to digital output values of 0 and 4000 are set outside of the temperature measurement range, the digital values corresponding to temperature input values lying outside of the temperature measurement range are interpolated proportional to the temperature input, providing that the value lies inside of the permitted measurement range shown in the table below.

However, if the temperature exceeds the maximum or minimum temperature limit of the permitted temperature range, the digital value is fixed at the value corresponding to the maximum or minimum temperature limit, respectively.

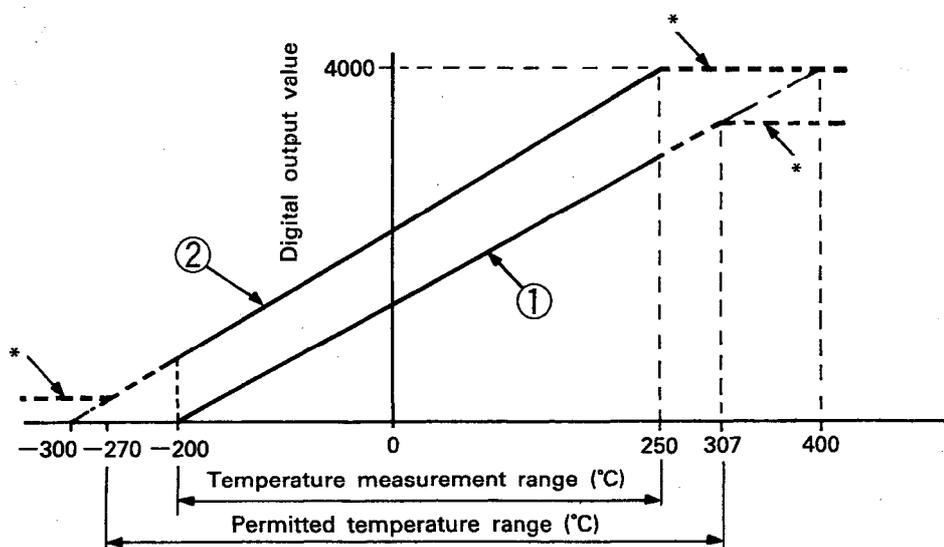

JIS Standard	ANSI Standard	DIN Standard	BS Standard	Measurement Range	1	2	3	4
B	B	—	PtRh30 -PtRh6	Temperature measurement range (°C)		100 to 1800		
				Permitted temperature range (°C)		44 to 1820		
R	R	—	PtRh13 -Pt	Temperature measurement range (°C)		0 to 1700		
				Permitted temperature range (°C)		0 to 1769		
S	S	PtRh -Pt	PtRh10 -Pt	Temperature measurement range (°C)		0 to 1700		
				Permitted temperature range (°C)		0 to 1769		
K	K	NiCr -Ni	NiCr -NiAl	Temperature measurement range (°C)	-200 to 250	0 to 500	0 to 1000	0 to 1300
				Permitted temperature range (°C)	-270 to 307	0 to 602	0 to 1232	0 to 1372
E	E	—	NiCr -CuNi	Temperature measurement range (°C)	-200 to 150	0 to 300	0 to 600	0 to 1000
				Permitted temperature range (°C)	-270 to 187	0 to 350	0 to 661	0 to 1000
J	J	—	Fe -CuNi	Temperature measurement range (°C)	-200 to 200	0 to 400	0 to 800	0 to 1200
				Permitted temperature range (°C)	-210 to 231	0 to 457	0 to 870	0 to 1200
T	T	—	Cu -CuNi	Temperature measurement range (°C)	-200 to 200	0 to 400		
				Permitted temperature range (°C)	-270 to 258	0 to 400		
—	—	Fe -CuNi	—	Temperature measurement range (°C)		0 to 400	0 to 800	0 to 900
				Permitted temperature range (°C)		0 to 450	0 to 855	0 to 900
—	—	Cu -CuNi	—	Temperature measurement range (°C)		0 to 400	0 to 600	
				Permitted temperature range (°C)		0 to 463	0 to 600	

For a JIS standard, K type thermocouple with the A60MXT measurement range set to "1," the following temperature ranges apply:

Temperature measurement range :  $-200$  to  $250^{\circ}\text{C}$

Permitted temperature range :  $-270$  to  $307^{\circ}\text{C}$

- ① A temperature of  $-200^{\circ}\text{C}$  is set to correspond to a digital output value of 0 and a temperature of  $400^{\circ}\text{C}$  is set to correspond to a digital output value of 4000.
- ② A temperature of  $-300^{\circ}\text{C}$  is set to correspond to a digital output value of 0 and a temperature of  $250^{\circ}\text{C}$  is set to correspond to a digital output value of 4000.

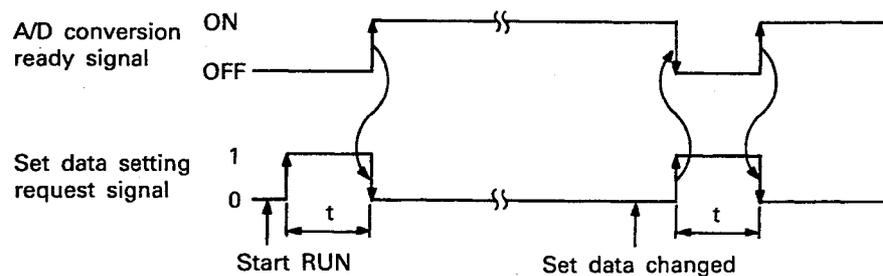

\*Avoid operation in the areas indicated with dotted lines as they do not meet accuracy specifications.

## 5.4.5 Set data setting request

"1" must be written to buffer memory address 18H when the set data of conversion enable/disable designation, temperature settings corresponding to digital output values, error compensation value setting and used thermocouple type setting have been written to the buffer memory during initial setting or temperature/digital conversion operation. When "1" is written to this area, the A/D conversion ready signal is turned off, the set data is written from the buffer memory to the set data memory, all channel data is checked, and the A/D conversion ready signal is turned on to start A/D conversion.

- (1) After making the initial settings, A/D conversion cannot be started until "1" is written to this area.
- (2) The "1" written to the set data setting area is automatically reset to "0" when the A/D conversion ready signal is turned on.
- (3) The set data setting request signal and A/D conversion ready signal are turned on and off as shown below.

$t$  = sampling period (ms) (Refer to Section 3.3.2.)

- (4) "1" must be written to this area after the set data is changed during A/D conversion operation or A/D conversion continues with the previous values. During A/D conversion, write the "1" to memory by sending a TO instruction as a pulsed TOP instruction. Error 13 occurs if "1" is written continuously using a TO instruction.
- (5) A setting error occurs and the error code 12 is written to buffer memory address 1H if an attempt is made to write a value other than "1" to the setting area. The operation status is then as follows:

During initial setting: A/D conversion is not executed.

During A/D conversion: Processing continues with the previous conditions.

After the correct value is written, the error code should be cleared by writing "0" from the sequence program to the buffer memory address 1H.  
(Refer to Section 5.12.)

**POINT**

Always write "1" to the set data setting area with a TOP instruction executed for one scan only.  
An error occurs and processing stops if "1" is written continuously with the TO instruction.

### 5.5 Error Compensation Settings

Maintain thermocouples of channels for which compensation is to be carried out at a standard temperature and determine the errors between the measured and standard temperatures. Set these errors as the compensation values in the buffer memory addresses 80<sub>H</sub> to FF<sub>H</sub>.

#### (1) Measuring the standard temperature

- (a) Turn on the detected temperature value LED display request signal (Y10) and specify the channel for which the standard temperature is to be measured with the A616TD INPUT and MX CH. switches.
- (b) Maintain the thermocouple connected to this channel at the standard temperature and read the measured value from the LED display.
- (c) The standard temperature must lie within the temperature measurement range.

#### (2) Determining the error compensation values

- (a) Use the Thermoelectromotive Force Table in Appendix 1 to determine the thermoelectromotive force  $V_{st}$  ( $\mu V$ ) produced by the thermocouple at the standard temperature and the thermoelectromotive force  $V_{mt}$  ( $\mu V$ ) obtained at the measured temperature (indicated on the LED display).
- (b) Determine the difference between these two thermoelectromotive force values and set this difference as the error compensation value.

$$\text{Error compensation value} = V_{mt} - V_{st}$$

### Example

If a temperature of 2°C is displayed the A616TD LED display using a JIS standard K type thermocouple at a standard temperature of 0°C.

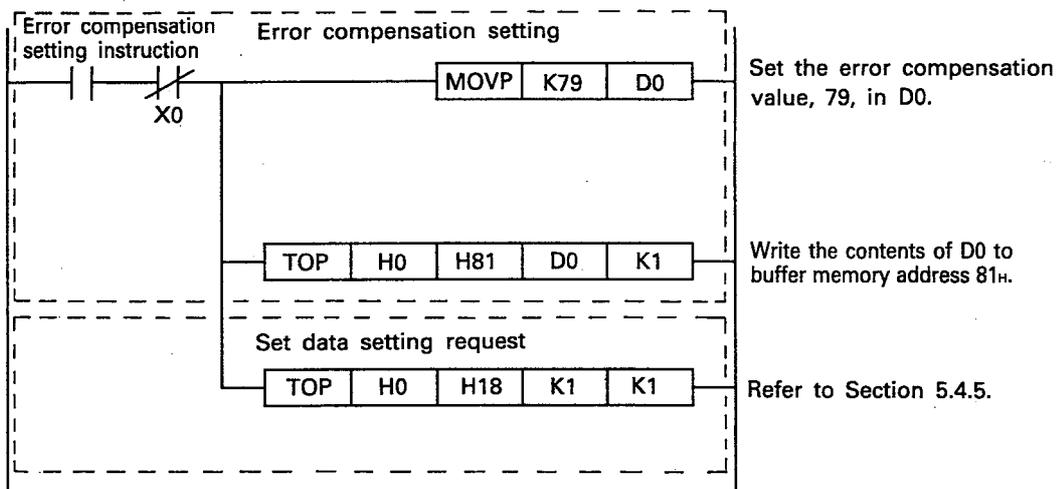

The thermoelectromotive forces are:

0 μV at 0°C (Vst)

79 μV at 2°C (Vmt)

The error compensation value is therefore:

$79 - 0 = 79 \mu\text{V}$  (Vmt - Vst)

### (3) Setting range for error compensation values

Set the error compensation value in the range -4000 to 4000 μV.

The accuracy of output data cannot be guaranteed if the error compensation value lies outside this range.

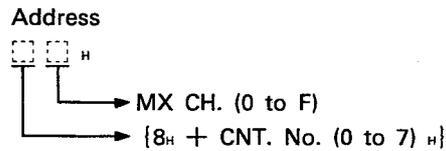

### (4) The default value of "0" is written for all channels when the power supply is turned on or the PLC CPU reset.

- (5) The setting area of buffer memory addresses 80<sub>H</sub> to FF<sub>H</sub> is configured as follows.

Address

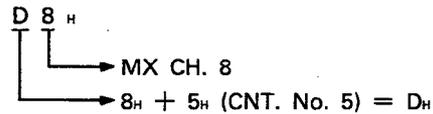

80 <sub>H</sub>	CNT. No. 0	MX CH. 0	No setting required.
81 <sub>H</sub>		MX CH. 1	Error compensating value setting area
82 <sub>H</sub>		MX CH. 2	Error compensating value setting area
to		⋮	
8F <sub>H</sub>		MX CH. F	Error compensating value setting area
90 <sub>H</sub>	CNT. No. 1	MX CH. 0	No setting required.
91 <sub>H</sub>		MX CH. 1	Error compensating value setting area
92 <sub>H</sub>		MX CH. 2	Error compensating value setting area
to		⋮	
9F <sub>H</sub>		MX CH. F	Error compensating value setting area
to	⋮		
F0 <sub>H</sub>	CNT. No. 7	MX CH. 0	No setting required.
F1 <sub>H</sub>		MX CH. 1	Error compensating value setting area
F2 <sub>H</sub>		MX CH. 2	Error compensating value setting area
to		⋮	
FF <sub>H</sub>		MX CH. F	Error compensating value setting area

The relationship between the area addresses and channel numbers is as follows:

Example

Address of MX CH.8 of the CNT NO. 5 A60MXT module:

**POINT**

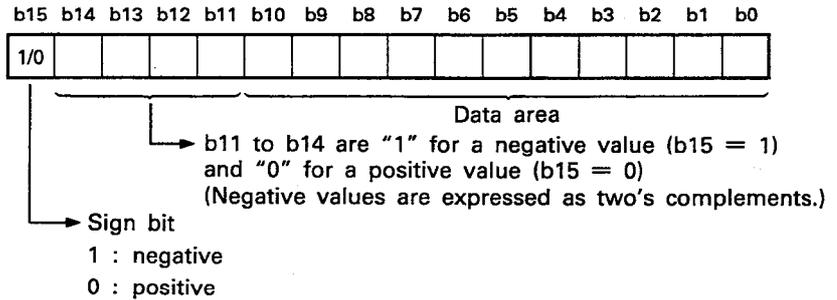

No settings are required for MX CH. 0 as the cold-junction compensation thermoresistors (Pt100) are connected to these channels. Settings made for these channels are ignored.

5.6 Reading the Digital Output Values

The temperatures input to the A60MXT channels from the temperature sensors are sampled and temperature/digital conversion is carried out for each channel. The digital output values are linearized and stored for each channel in the buffer memory addresses 180<sub>H</sub> - 1FF<sub>H</sub>.

The digital output value can be read by the PLC CPU for any channel by specifying the buffer memory address.

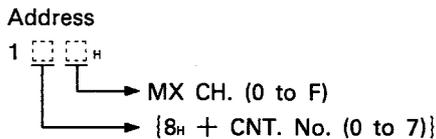

- (1) The 16-bit configuration of the memory area for storage of MX CH. channel digital output values is shown below.

- (2) The buffer memory addresses 180<sub>H</sub> - 1FF<sub>H</sub> for storage of digital output values are configured as follows.

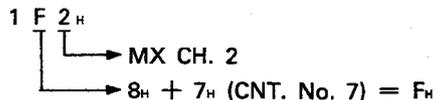

Address		
180 <sub>H</sub>	CNT. No. 0	MX CH. 0      Digital output value
181 <sub>H</sub>		MX CH. 1      Digital output value
182 <sub>H</sub>		MX CH. 2      Digital output value
to		⋮
18F <sub>H</sub>		MX CH. F      Digital output value
190 <sub>H</sub>	CNT. No. 1	MX CH. 0      Digital output value
191 <sub>H</sub>		MX CH. 1      Digital output value
192 <sub>H</sub>		MX CH. 2      Digital output value
to		⋮
19F <sub>H</sub>		MX CH. F      Digital output value
to	⋮	
1F0 <sub>H</sub>	CNT. No. 7	MX CH. 0      Digital output value
1F1 <sub>H</sub>		MX CH. 1      Digital output value
1F2 <sub>H</sub>		MX CH. 2      Digital output value
to		⋮
1FF <sub>H</sub>		MX CH. F      Digital output value

The relationship between the area addresses and channel numbers is as follows:

Example

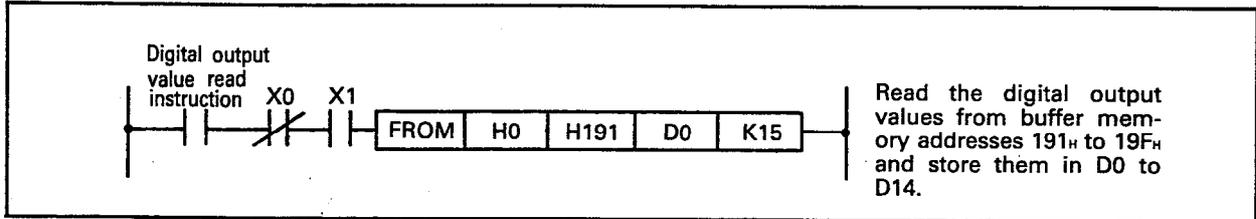

Address of MX CH. 2 of the CNT NO. 7 A60MXT module:

(3) "0" is always written for MX CH. 0 of CNT NO. 0 to 7 as the cold-junction compensation thermoresistors (Pt100) are connected to these channels.

(4) Program example

Normal read of the digital output values from channels 1 to F of the A60MXT module connected to channel 1 of the A616TD module to addresses D0 to D14.

5.7 Reading the Detected Temperature Values

The temperatures input to the A60MXT channels from the temperature sensors are converted to detected temperature values for each channel and stored in the buffer memory addresses 200<sub>H</sub> to 27F<sub>H</sub>.

The detected temperature value can be read by the PLC CPU for any channel by specifying the buffer memory address.

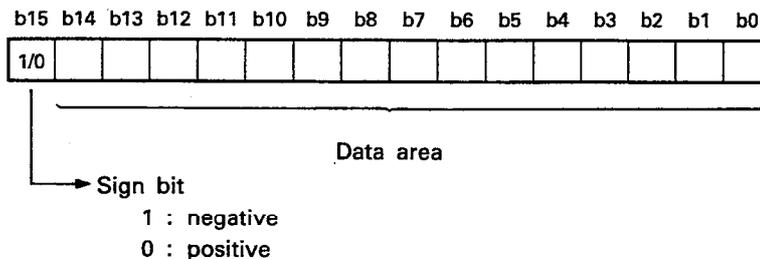

- (1) The values stored in the buffer memory are ten times the temperature in Celsius.

Example

49.3°C is stored as  $49.3 \times 10 = 493$ .

Storage data

- (2) The 16-bit configuration of the memory area for storage of detected temperature values is shown below.

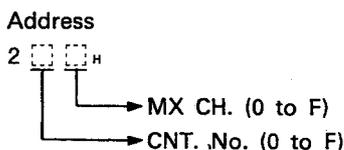

(3) The buffer memory addresses 200<sub>H</sub> to 27F<sub>H</sub> for storage of detected temperature values are configured as follows.

Address

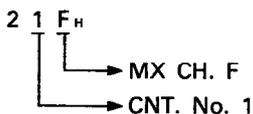

200 <sub>H</sub>	CNT. No. 0	MX CH. 0	Detected temperature value
201 <sub>H</sub>		MX CH. 1	Detected temperature value
202 <sub>H</sub>		MX CH. 2	Detected temperature value
to		⋮	
20F <sub>H</sub>		MX CH. F	Detected temperature value
210 <sub>H</sub>	CNT. No. 1	MX CH. 0	Detected temperature value
211 <sub>H</sub>		MX CH. 1	Detected temperature value
212 <sub>H</sub>		MX CH. 2	Detected temperature value
to		⋮	
21F <sub>H</sub>		MX CH. F	Detected temperature value
to	⋮		
270 <sub>H</sub>	CNT. No. 7	MX CH. 0	Detected temperature value
271 <sub>H</sub>		MX CH. 1	Detected temperature value
272 <sub>H</sub>		MX CH. 2	Detected temperature value
to		⋮	
27F <sub>H</sub>		MX CH. F	Detected temperature value

The relationship between the area addresses and channel numbers is as follows:

Example

Address of MX CH. F of the CNT NO. 1 A60MXT module:

(4) The terminal block temperature is always stored for MX CH. 0 of CNT NO. 0 to 7

5.8 Detected Temperature Value Celsius - Fahrenheit Conversion Program

A program to convert the detected temperature value stored in the buffer memory addresses 200<sub>H</sub> - 27F<sub>H</sub> as a value equal to ten times the Celsius temperature (°C) can be converted to a value equal to ten times the Fahrenheit temperature (°F) using the program listed below.

(1) Conversion formula

$$\begin{aligned} \text{Detected temperature value} &= \text{Celsius temperature} \times 10 \\ \text{Fahrenheit temperature} &= \text{Celsius temperature} \times 1.8 + 32 \end{aligned}$$

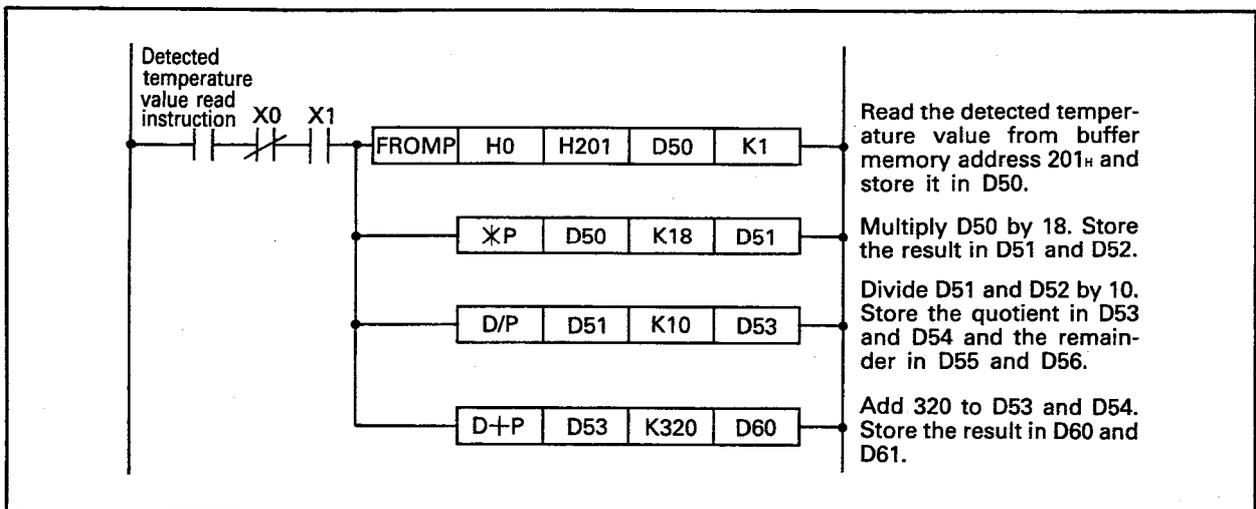

$$= \frac{\text{Detected temperature value}}{10} \times 1.8 + 32$$

$$\text{Therefore, Fahrenheit temperature} \times 10 = \frac{\text{Detected temperature value} \times 18}{10} + 320$$

Multiplying the temperature by ten permits handling of the temperature to the first decimal place.

(2) Program example

Store the detected temperature value from MX CH. 1 of the A60MXT connected to A616TD INPUT 0 into D50. Convert this value to Fahrenheit and store the converted value in D60.

5.9 External Fault Detection

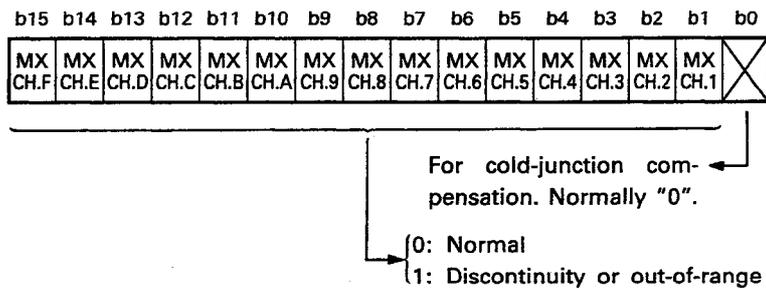

External fault data is stored to the buffer memory if a discontinuity occurs in a thermocouple or compensation lead, or if an abnormal temperature value is input.

5.9.1 Reading the faulty channel number

When a discontinuity is detected in a thermocouple or compensation lead, "1" is written to the bit of addresses 40<sub>H</sub> to 47<sub>H</sub> of buffer memory which corresponds to the channel for which the fault was detected.

(1) When a discontinuity is detected for any of the A60MXT channels for which discontinuity detection is enabled, "1" is written to the bit which corresponds to the channel and the discontinuity error signal X3 is turned on.

(2) The 16-bit configuration of the memory area is shown below.

(3) The storage area in buffer memory addresses 40<sub>H</sub> to 47<sub>H</sub> is configured as follows.

Address

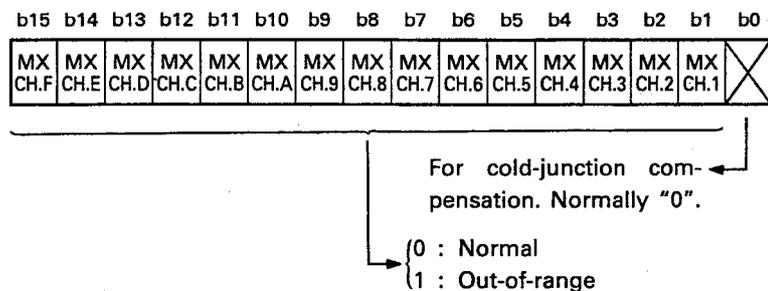

40 <sub>H</sub>	CNT. No.0 MX CH. 1 to F	Channel for which discontinuity detected
41 <sub>H</sub>	CNT. No.1 MX CH. 1 to F	Channel for which discontinuity detected
42 <sub>H</sub>	CNT. No.2 MX CH. 1 to F	Channel for which discontinuity detected
43 <sub>H</sub>	CNT. No.3 MX CH. 1 to F	Channel for which discontinuity detected
44 <sub>H</sub>	CNT. No.4 MX CH. 1 to F	Channel for which discontinuity detected
45 <sub>H</sub>	CNT. No.5 MX CH. 1 to F	Channel for which discontinuity detected
46 <sub>H</sub>	CNT. No.6 MX CH. 1 to F	Channel for which discontinuity detected
47 <sub>H</sub>	CNT. No.7 MX CH. 1 to F	Channel for which discontinuity detected

(4) This data remains stored in buffer memory after the cause of the fault has been corrected. Write "0" to the buffer memory addresses 40<sub>H</sub> to 47<sub>H</sub> with a sequence program to clear the external fault data. (Refer to Section 5.12.)

5.9.2 Reading the digital output value out-of-range channel number

If a temperature is input which exceeds the range specified by the temperatures set to correspond to digital output values (refer to Section 5.4.4), "1" is written to the bit of addresses 50<sub>H</sub> to 57<sub>H</sub> of buffer memory which corresponds to the channel for which the out-of-range temperature was detected.

- (1) If a temperature is input which exceeds the temperature value range specified by the temperatures set to correspond to digital output values (refer to Section 5.4.4), "1" is written to the bit which corresponds to the channel for which the out-of-range temperature was detected and the digital output value out-of-range error signal X4 is turned on.
- (2) The 16-bit configuration of the memory area is shown below.

- (3) The storage area in buffer memory addresses 50<sub>H</sub> to 57<sub>F<sub>H</sub></sub> is configured as follows.

Address

50 <sub>H</sub>	CNT. No.0	MX CH. 1 to F	Channel for which out-of-range value detected
51 <sub>H</sub>	CNT. No.1	MX CH. 1 to F	Channel for which out-of-range value detected
52 <sub>H</sub>	CNT. No.2	MX CH. 1 to F	Channel for which out-of-range value detected
53 <sub>H</sub>	CNT. No.3	MX CH. 1 to F	Channel for which out-of-range value detected
54 <sub>H</sub>	CNT. No.4	MX CH. 1 to F	Channel for which out-of-range value detected
55 <sub>H</sub>	CNT. No.5	MX CH. 1 to F	Channel for which out-of-range value detected
56 <sub>H</sub>	CNT. No.6	MX CH. 1 to F	Channel for which out-of-range value detected
57 <sub>H</sub>	CNT. No.7	MX CH. 1 to F	Channel for which out-of-range value detected

- (4) This data remains stored in buffer memory after the cause of the fault has been corrected. Write "0" to the buffer memory addresses 50<sub>H</sub> to 57<sub>F<sub>H</sub></sub> with a sequence program to clear the external fault data. (Refer to Section 5.12.)

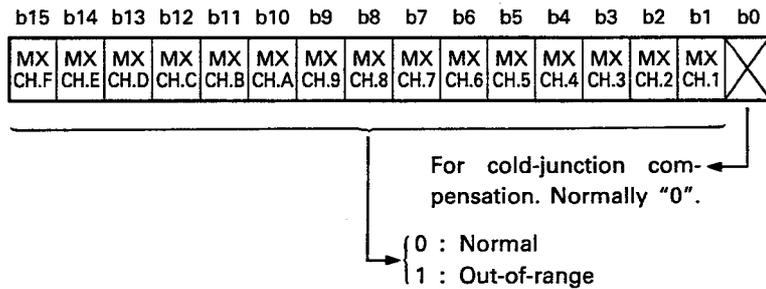

**POINT**

If the measured temperature is within the temperature range preset by temperature settings corresponding to digital output values, "1" is stored into the bit position of the corresponding channel when the measured temperature is outside the permissible temperature range.

5.9.3 Reading the detected temperature value out-of-range channel number

If a temperature is input which exceeds the range specified by the measurement range setting, "1" is written to the bit of addresses 60<sub>H</sub> to 67<sub>H</sub> of buffer memory which corresponds to the channel for which the out-of-range temperature was detected.

- (1) If a temperature is input which exceeds the measurement range setting (refer to Section 4.4), "1" is written to the bit which corresponds to the channel for which the out-of-range temperature was detected and the detected temperature value out-of-range error signal X5 is turned on.
- (2) A detected temperature value out-of-range error is also detected in the case of a discontinuity detection error, so that "1" is also written to the bit which corresponds to the channel in this case.
- (3) The 16-bit configuration of the memory area is shown below.

- (4) The storage area in buffer memory addresses 60<sub>H</sub> to 67<sub>H</sub> is configured as follows.

Address

60 <sub>H</sub>	CNT. No.0 MX CH. 1 to F	Channel for which out-of-range value detected
61 <sub>H</sub>	CNT. No.1 MX CH. 1 to F	Channel for which out-of-range value detected
62 <sub>H</sub>	CNT. No.2 MX CH. 1 to F	Channel for which out-of-range value detected
63 <sub>H</sub>	CNT. No.3 MX CH. 1 to F	Channel for which out-of-range value detected
64 <sub>H</sub>	CNT. No.4 MX CH. 1 to F	Channel for which out-of-range value detected
65 <sub>H</sub>	CNT. No.5 MX CH. 1 to F	Channel for which out-of-range value detected
66 <sub>H</sub>	CNT. No.6 MX CH. 1 to F	Channel for which out-of-range value detected
67 <sub>H</sub>	CNT. No.7 MX CH. 1 to F	Channel for which out-of-range value detected

- (5) This data remains stored in buffer memory after the cause of the fault has been corrected. Write "0" to the buffer memory addresses 60<sub>H</sub> to 67<sub>H</sub> with a sequence program to clear the external fault data. (Refer to Section 5.12.)

**5.10 Reading the Current Sampling Period**

The sampling period is determined by multiplying the number of conversion channels for the A60MXT module with the largest number of conversion channels enabled by 50 milliseconds (refer to Section 3.3.2). The value is stored in buffer memory address 4<sub>H</sub>.

- (1) The value of the sampling period is upgraded each time the number of A60MXT channels for which conversion is enabled is changed.
- (2) The sampling period is stored in this area in millimeters.

**Example**

A sampling period of 800ms is stored as the value 800.

- (3) "0" is stored in this area if conversion is disabled for all channels of all A60MX[ ] units connected to the A616TD, or if the A616TD is used alone.

**5.11 Reading Error Codes**

When the A616TD detects an error, the corresponding error code is stored in buffer memory address 1<sub>H</sub> as a binary code.

- (1) The stored error code is upgraded each time an error is detected, and the previous value is cleared.
- (2) If an error occurs which results in an error code from 01 to 04, such as a faulty A60MXT module or a setting error, "1" is written to the bit of the buffer memory address 2<sub>H</sub> which corresponds to the CNT NO. of the faulty module. "1" is written to this address for the appropriate CNT. NO. each time a new error occurs, and this data remains stored until the area is cleared.

1) The 16-bit configuration of the memory area is shown below.

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
CNT.No.															
F	E	D	C	B	A	9	8	7	6	5	4	3	2	1	0

}

 0 : Normal  
 1 : Discontinuity or out-of-range

**5.12 Clearing the Error Code Area**

- (1) This data remains stored in buffer memory after the causes of the faults have been corrected. Write "0" to the buffer memory addresses 1<sub>H</sub> and 2<sub>H</sub> with a sequence program to clear the error data.

### 5.13 Programming for ACPU Remote I/O Station

When the A616TD is used on a remote I/O station, the master station (ACPU) should be programmed as described below.

#### 5.13.1 Programming instructions

The ACPU is controlled in direct or refresh I/O mode but data communication with a remote I/O station is made in batch refresh mode after the **END** (FEND) instruction is executed.

For full information on data link, see the Data Link System User's Manual.

- (1) Control timing must be noted. Since data is controlled via the link module, some delay may occur for communication of control data between the master station CPU and the A616TD on the remote I/O station.

- (2) The following instructions are used for data communication with the A616TD on the remote I/O station:

Data write from master station to remote I/O station A616TD:

**RTOP** instruction

Data read from remote I/O station A616TD to master station:

**RFRP** instruction

Data transfer between the master station CPU and A616TD is made by the link register (W). Hence, an appropriate program should be written so that the link register data is transferred to the other device after the **RFRP** instruction has been executed, and the required data is transferred to the link register before the **RTOP** instruction is executed.

- (3) The **RTOP** and **RFRP** instructions cannot be executed at the same time (within one scan) to one A616TD on the remote I/O station.

The signals on the following page must be used with the **RTOP** and **RFRP** instructions as interlock conditions.

The I/O signal numbers indicated are those assigned by the master station and correspond to X0 and Y1F in this example.

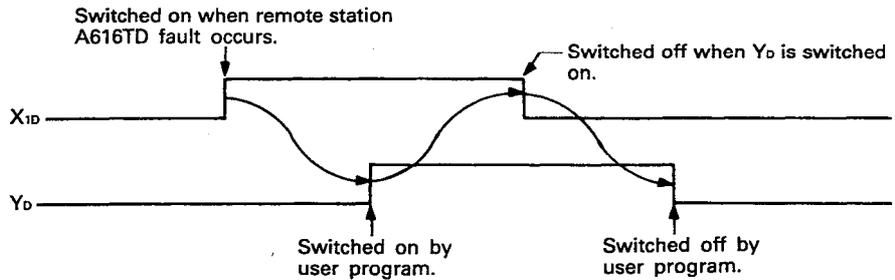

- (4) Control signals to remote I/O station

- $Y_{\square\square}$  may not be provided to the remote I/O station by PLS  $Y_{\square\square}$  because of the relation between the master station scan time and link scan time.
- After the **SET** instruction is executed, the pulse output for executing the **RST** instruction cannot be used because data communication between the master station and remote I/O station is made in batch refresh mode after the **END** (FEND) instruction is executed.

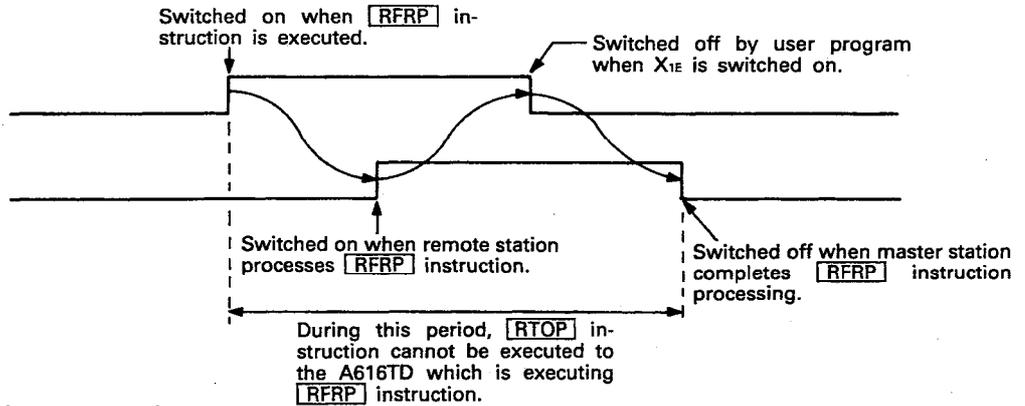

Signal Direction: PLC CPU to A616TD		Signal Direction: A616TD to PLC CPU	
Device number	Signal	Device number	Signal
Y <sub>0</sub> to Y <sub>c</sub>	Reserved.	X <sub>10</sub> to X <sub>1c</sub>	Reserved.
Y <sub>d</sub>	Used to switch off X <sub>1d</sub> .	X <sub>1d</sub>	Switched on if the <b>RFRP</b> or <b>RTOP</b> instruction cannot be executed due to a special function module fault.
Y <sub>e</sub>	Switched on automatically by the master station CPU when the <b>RFRP</b> instruction is executed. Must be reset by the user program after checking that X <sub>1e</sub> is on.	X <sub>1e</sub>	Switched on while the <b>RFRP</b> instruction is executed by the A616TD on the remote I/O station.
Y <sub>f</sub>	Switched on automatically by the master station CPU when the <b>RTOP</b> instruction is executed. Must be reset by the user program after checking that X <sub>1f</sub> is on.	X <sub>1f</sub>	Switched on while the <b>RTOP</b> instruction is executed by the A616TD on the remote I/O station.

Timing

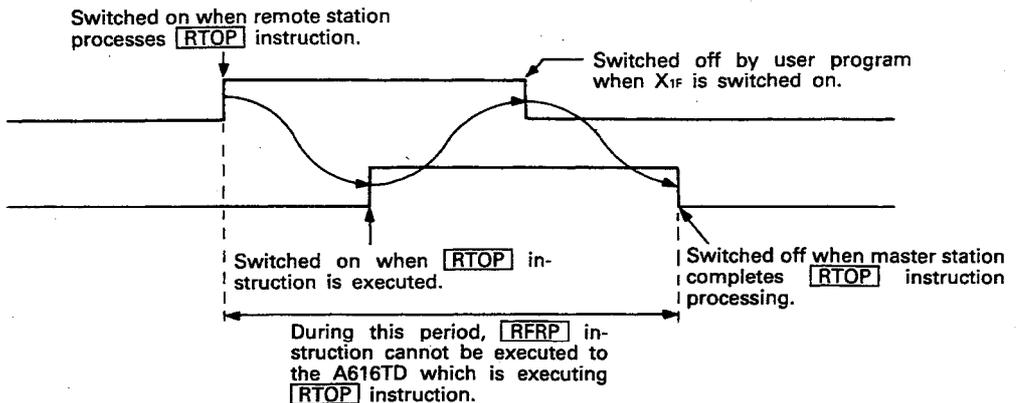

**RTOP**, **RFRP** instruction cannot be executed due to a special function module fault

**RFRP** instruction is executed

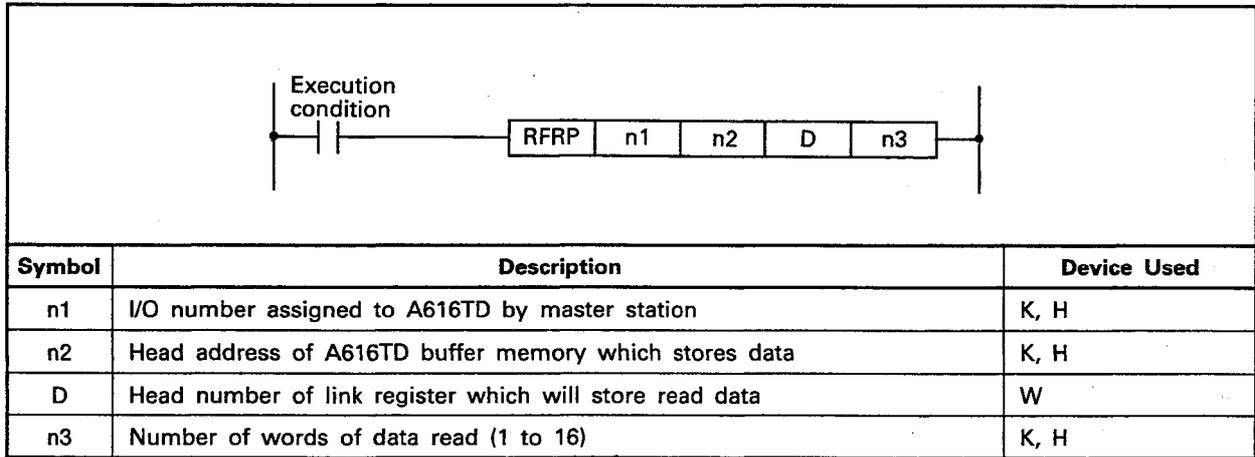

**RTOP** instruction is executed

5.13.2 Basic programs for read and write

(1) Read from remote I/O station A616TD

Format

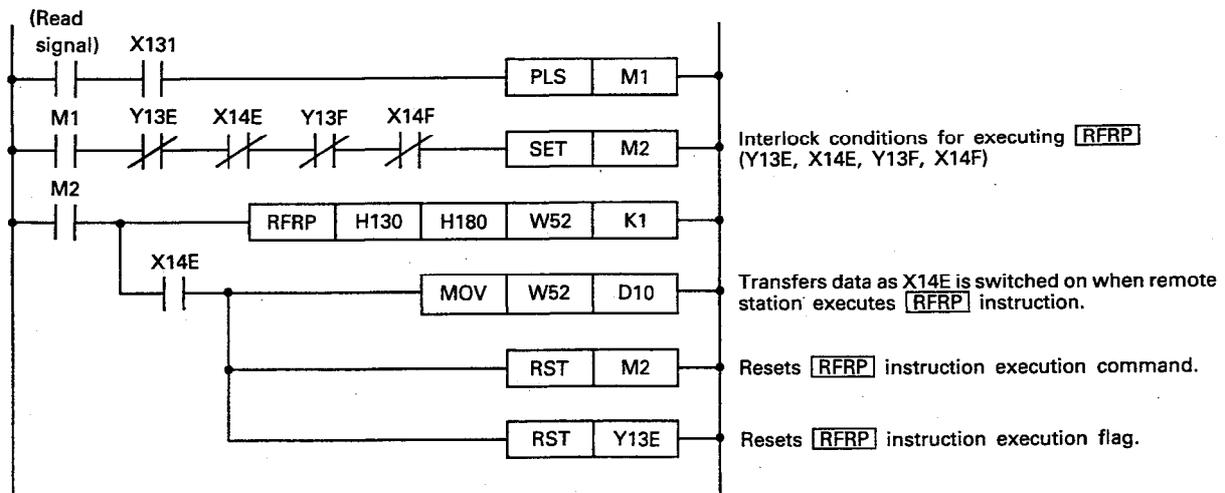

**POINT**

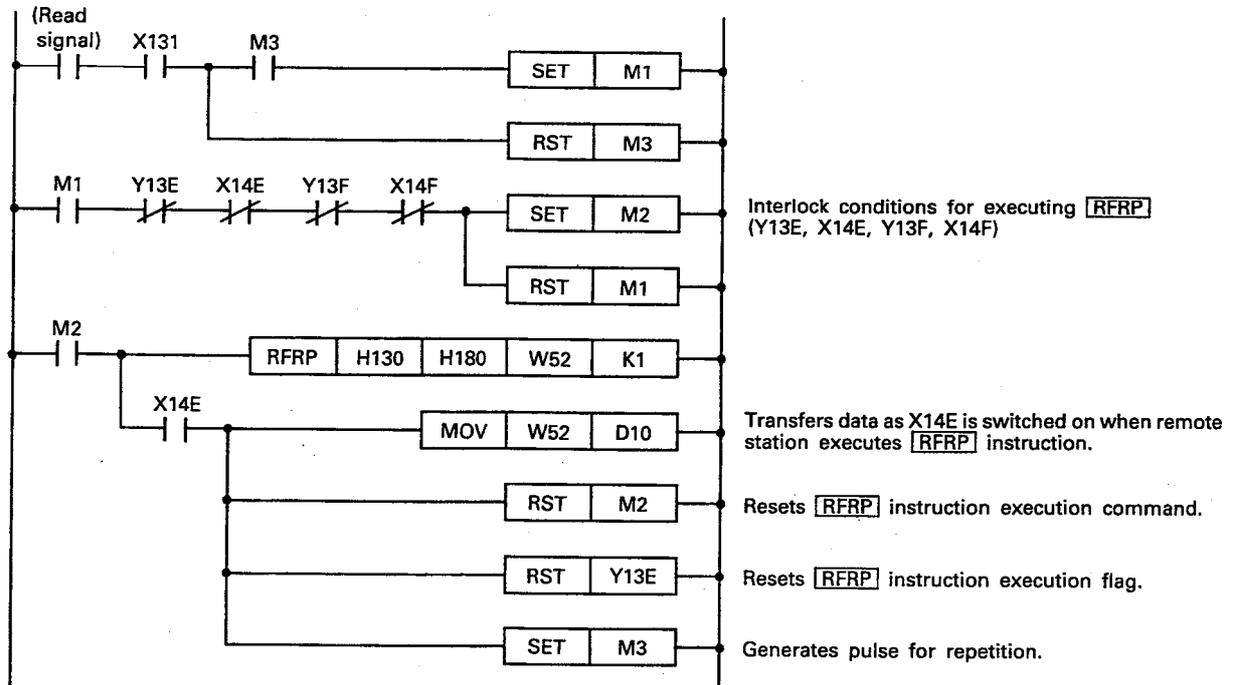

The number of digits of the head I/O signal, n1, is three for the **RFRP** and **RTOP** instructions.

Example: To read 1 word to W52 from the buffer memory address 180 (digital output value) of the remote I/O station A616TD assigned to X, Y130 to 14F by the master station.

To execute read only once by switching on the read signal

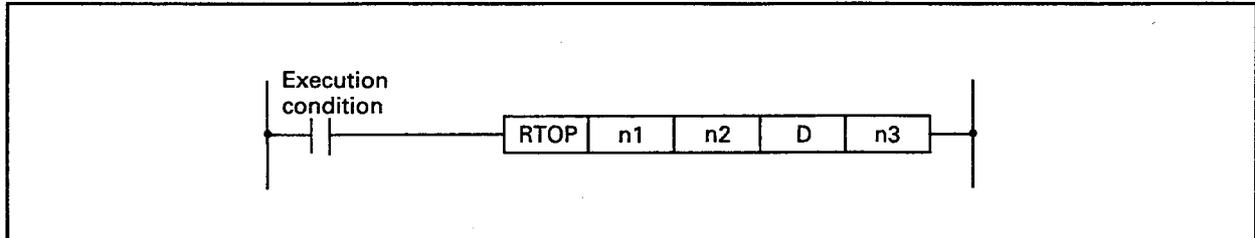

To continuously execute read while the read signal is on  
(Executed per two scans)

(2) Write to remote I/O station A616TD

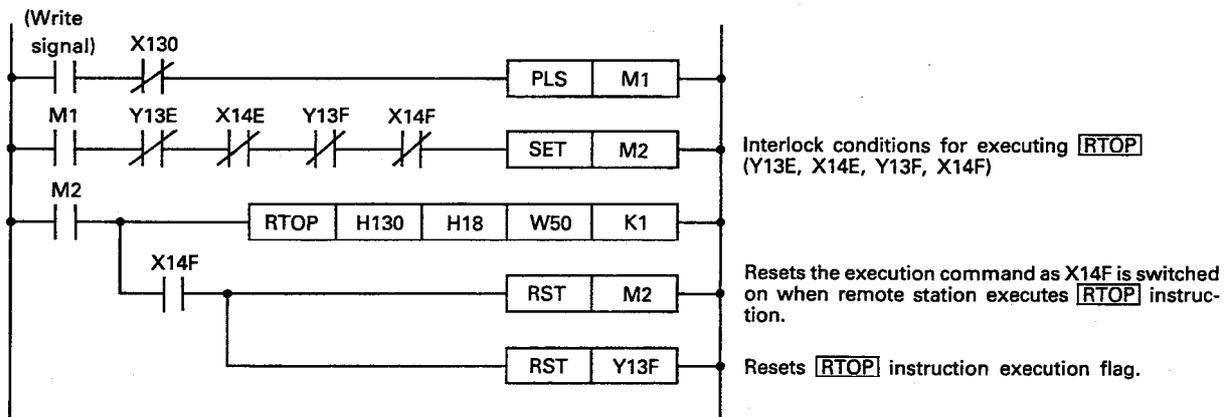

Format

Symbol	Description	Device Used
n1	I/O number assigned to A616TD by master station	K, H
n2	Head address of A616TD buffer memory which will store written data	K, H
D	Head number of link register which stores data	W
n3	Number of words of data written (1 to 16)	K, H

Example: To write 1 word from W50 to the buffer memory address 18 (set data setting request) of the remote I/O station A616TD assigned to X, Y130 to 14F by the master station.

To execute write only once by switching on the write signal

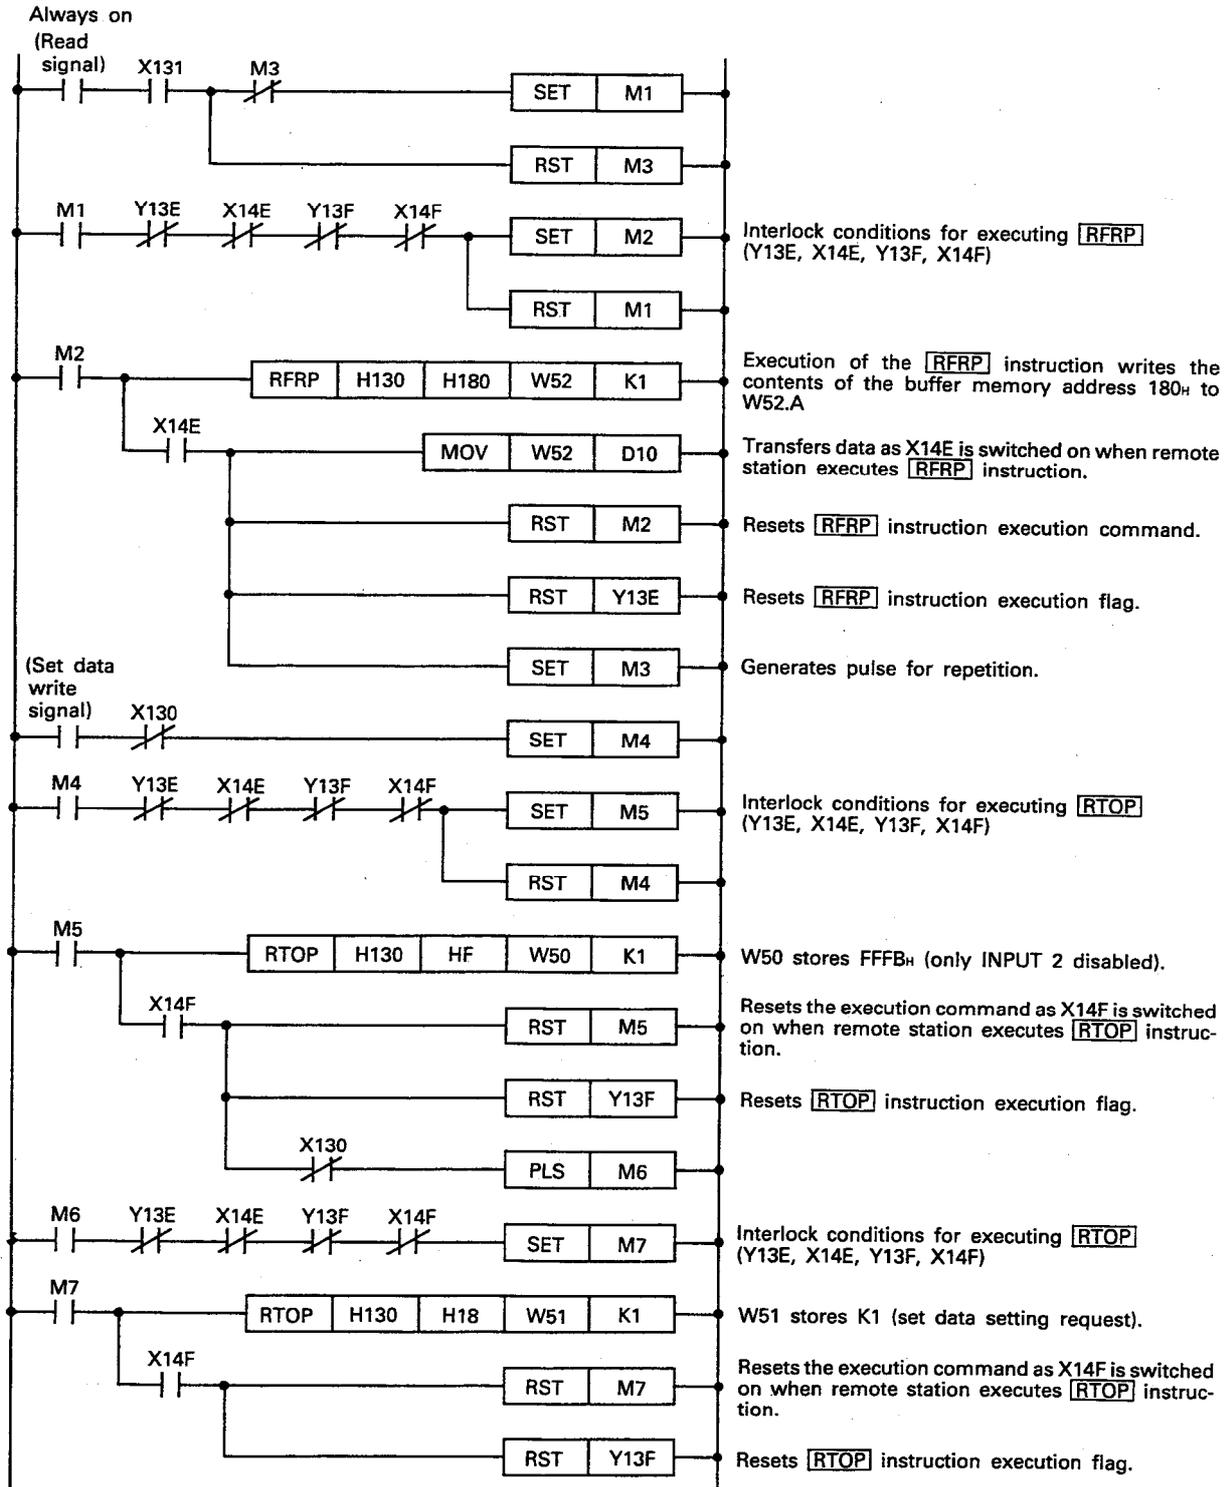

**POINT**

The number of digits of the head I/O signal, n1, is three for the **RFRP** and **RTOP** instructions.

(3) Reading continuously from remote I/O station A616TD and writing set data

Example: To disable the A616TD INPUT 2 from A/D conversion during continuous read of 1 word to W52 from the buffer memory address 180 (digital output value) of the remote I/O station A616 assigned to X, Y130-14F by the master station, and after defining disable, to read data from the buffer memory address 180 again.

6. ANALOG/DIGITAL CONVERSION FUNCTIONS

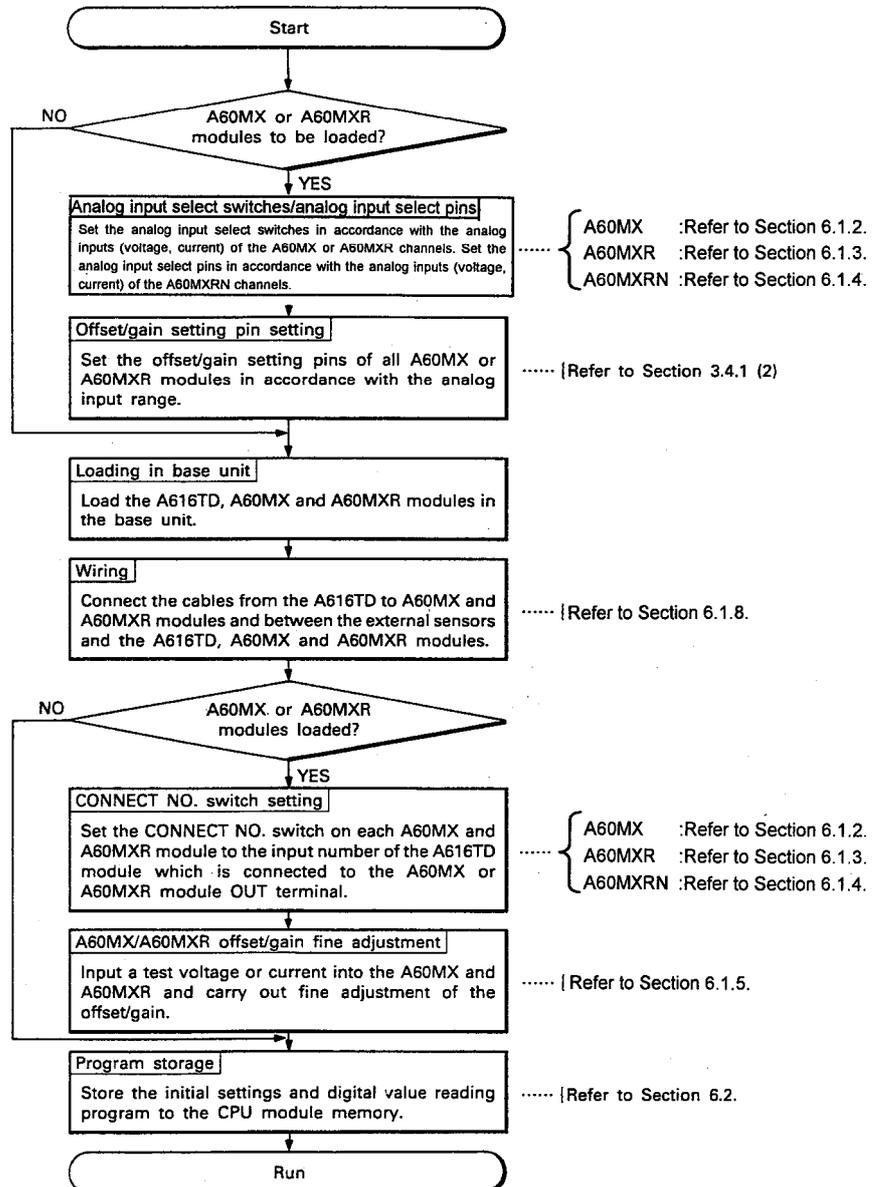

The setting procedure and programming method are described below for the analog/digital conversion (A/D conversion) of analog signals input directly to the A616TD INPUT channel or to a MX CH. channel of an A60MX or A60MXR module connected to an A616TD.

Refer to Chapters 4 and 5 for details of the setting procedure and programming method for temperature/digital conversion.

6.1 Pre-Operation Settings and Procedures

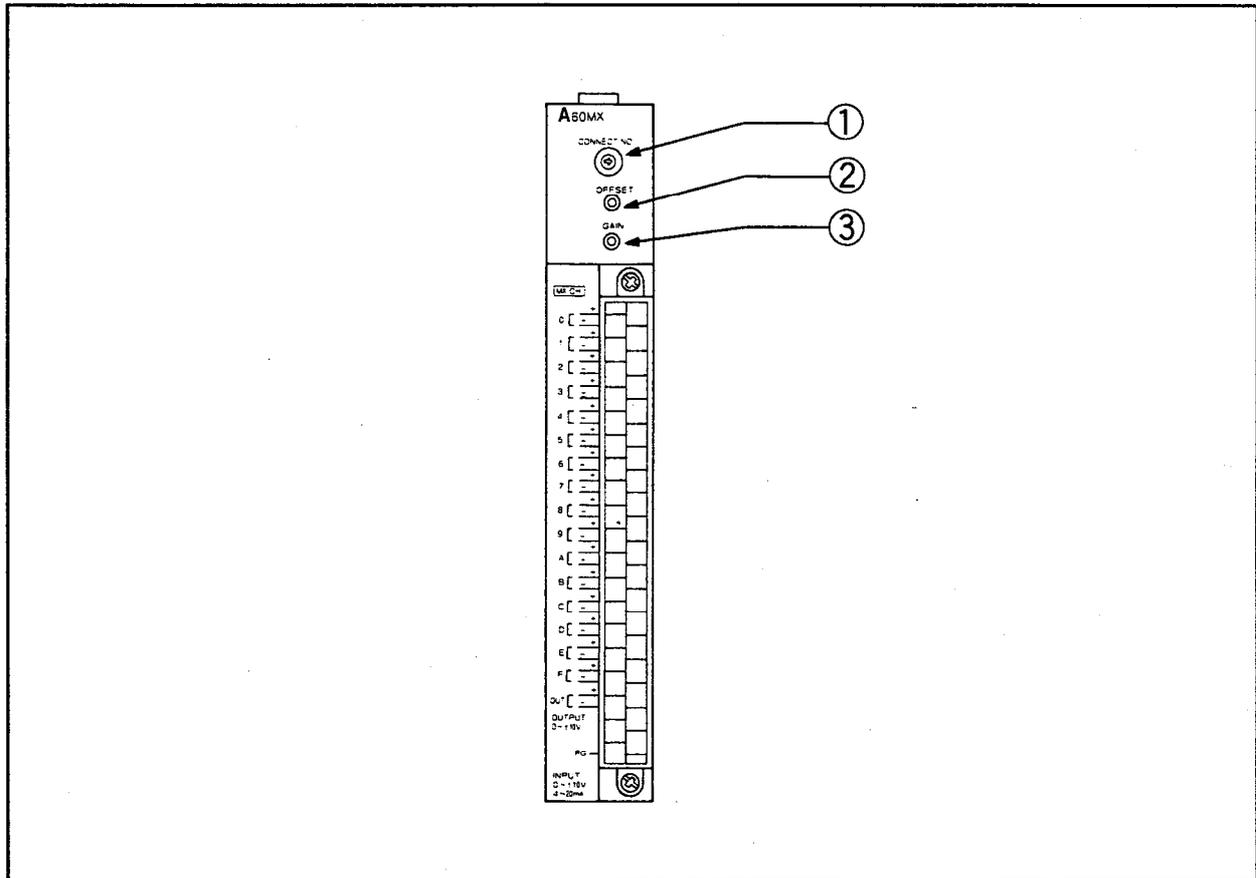

6.1.1 Pre-operation settings and procedures

Make the following settings before carrying out analog signal input into an A616TD module directly, or to an A60MX or A60MXR module connected to an A616TD module.

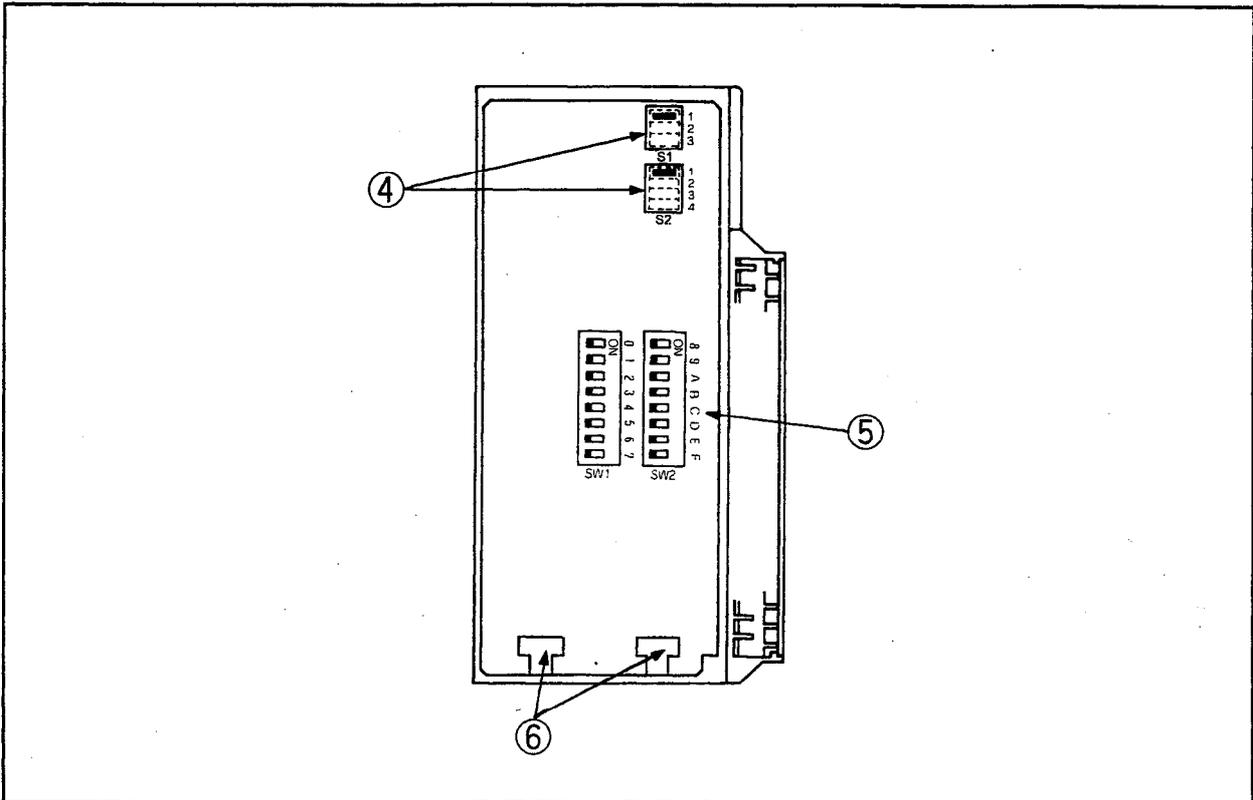

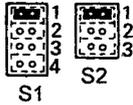

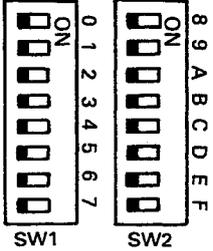

## 6.1.2 Description and settings of A60MX parts

Description and settings of A60MX parts.

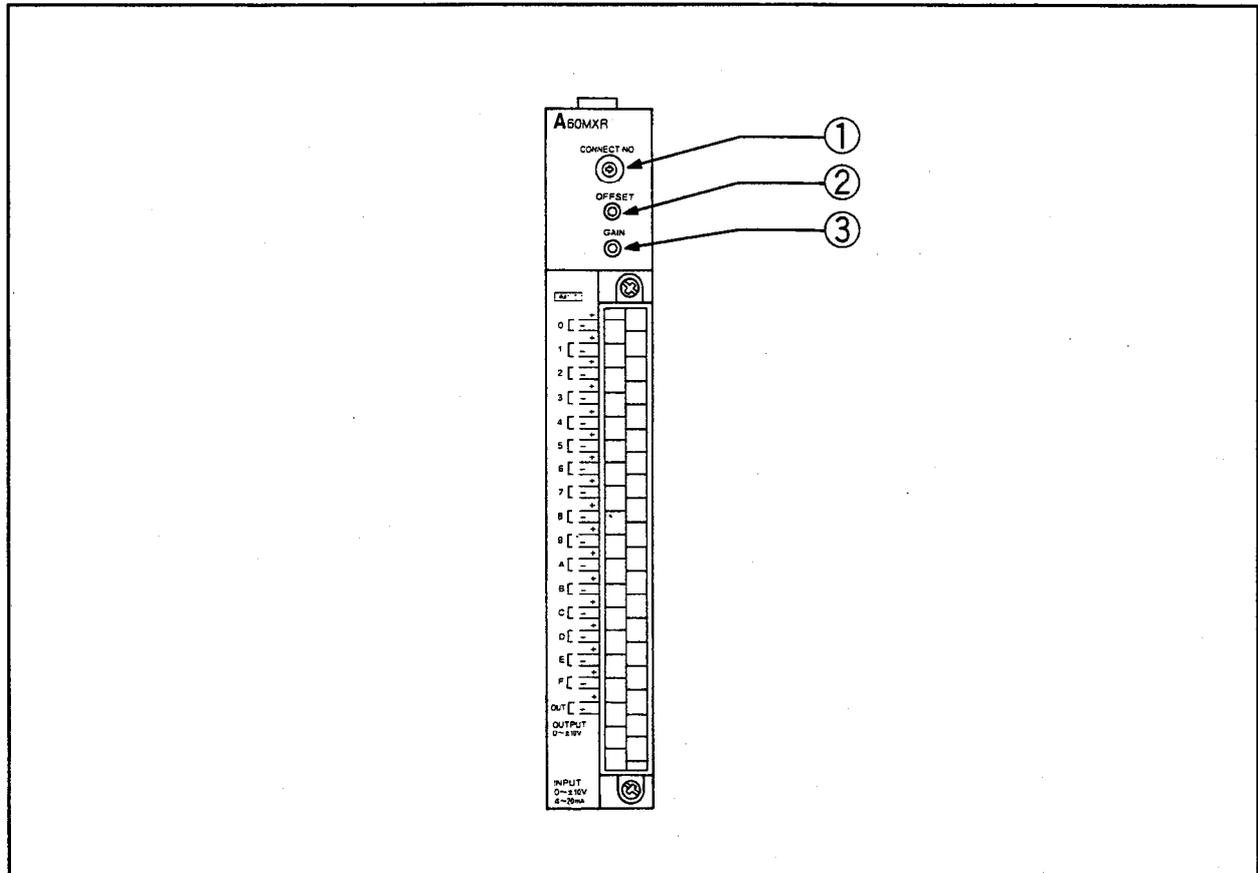

No.	Name and Appearance	Description
①	<p><b>CONNECT NO. switch</b></p> <p>CONNECT NO.</p> 	<p>Used to specify to which input of the A616TD the A60MX output is connected.</p> <p>Setting range: 0 to 7</p>
②	<p><b>Offset control</b></p> <p>OFFSET</p> 	<p>Used to make microadjustments of the offset value, which is selected by the setting pins S1 and S2 in the module.</p> <p>For further details, refer to Section 6.1.5, Offset/Gain Settings.</p>
③	<p><b>Gain control</b></p> <p>GAIN</p> 	<p>Used to make microadjustments of the gain value, which is selected by the setting pins S1 and S2 in the module.</p> <p>For further details, refer to Section 6.1.5, Offset/Gain Settings.</p>

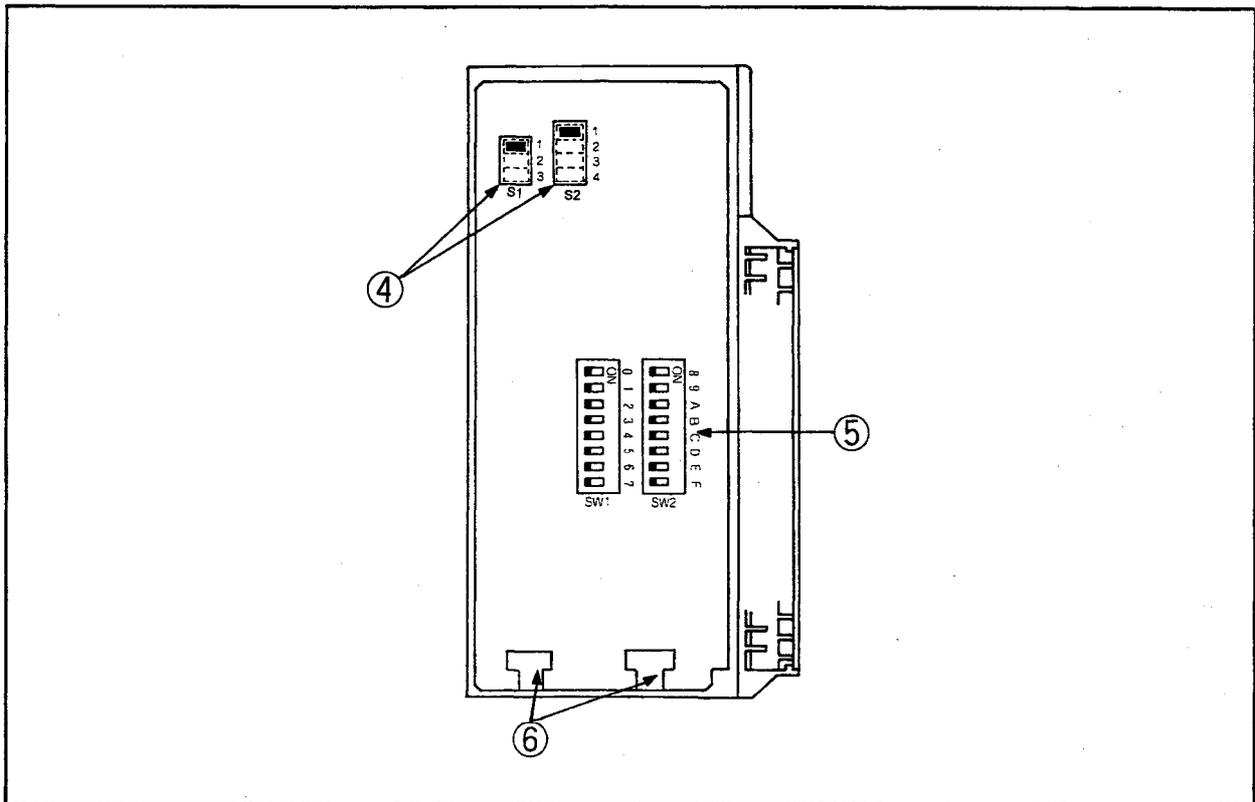

No.	Name and Appearance	Description
④	<p>Offset/gain setting pins</p> 	<p>Set the S1 and S2 offset/gain setting pins in accordance with the analog input voltage/current range and the setting of the A616TD offset/gain setting pins. For further details, refer to Section 3.4.1 (2) , A60MX and A60MXR Input Characteristics. Set to "1" on shipment from factory.</p>
⑤	<p>Analog input select switches</p> 	<p>Used to select the type of analog input (voltage or current) of each channel (CH. 0 to CH. F). OFF: Voltage input setting ON : Current input setting  Set to OFF on shipment from factory.</p>
⑥	<p>Extension cable connectors</p>	<p>For connection of an extension cable with an adjacent module when the A60MX, A60MXR or A60MXRN is further provided adjacent to the A60MX to increase channels. The extension cable may be connected to either connector.</p>

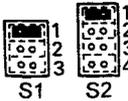

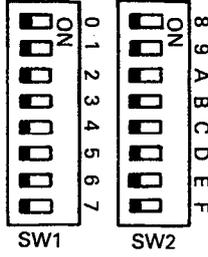

6.1.3 Description and settings of A60MXR parts

Description and settings of A60MXR parts.

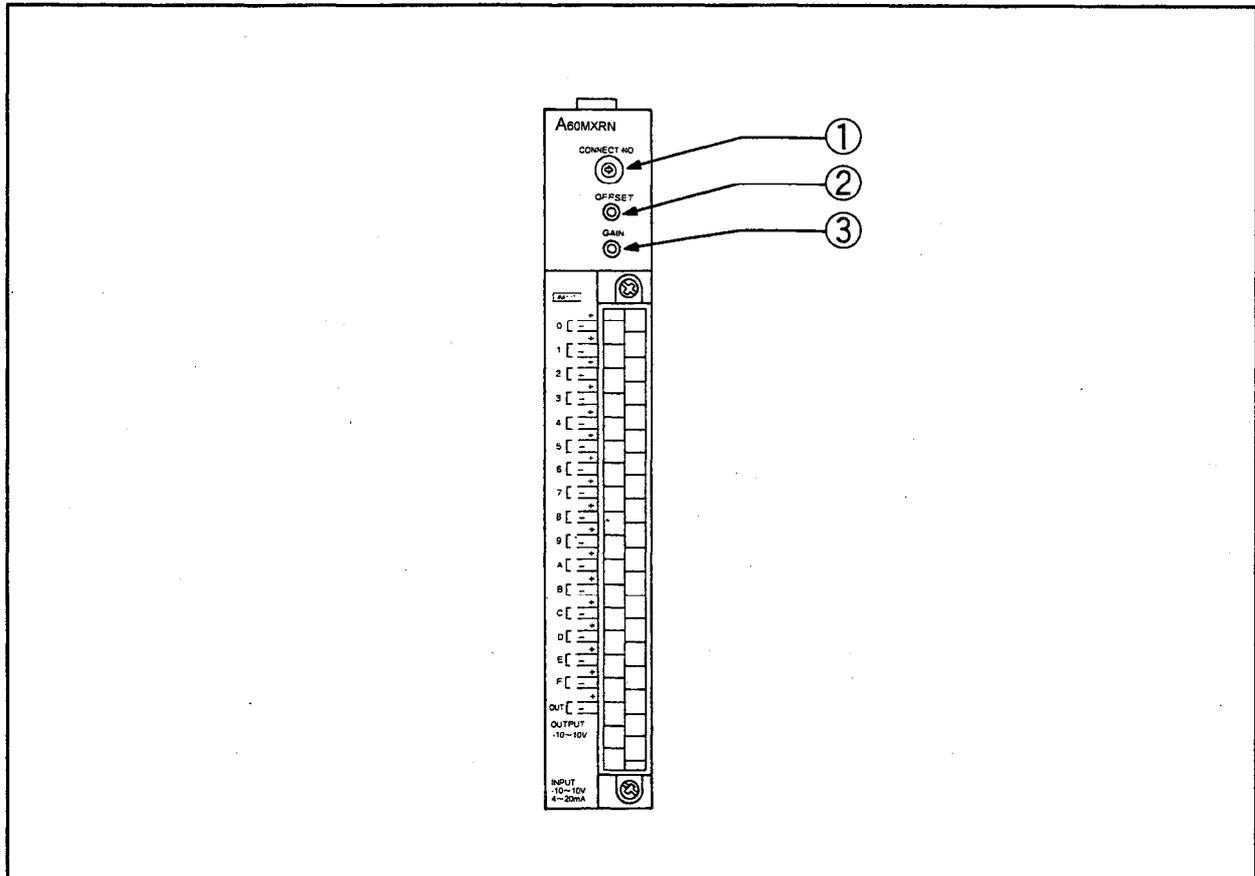

No.	Name and Appearance	Description
①	<p>CONNECT NO. switch</p> <p>CONNECT NO.</p> 	<p>Used to specify to which input of the A616TD the A60MXR output is connected.</p> <p>Setting range: 0 to 7</p>
②	<p>Offset control</p> <p>OFFSET</p> 	<p>Used to make microadjustments of the offset value, which is selected by the setting pins S1 and S2 in the module.</p> <p>For further details, refer to Section 6.1.5, Offset/Gain Settings.</p>
③	<p>Gain control</p> <p>GAIN</p> 	<p>Used to make microadjustments of the gain value, which is selected by the setting pins S1 and S2 in the module.</p> <p>For further details, refer to Section 6.1.5, Offset/Gain Settings.</p>

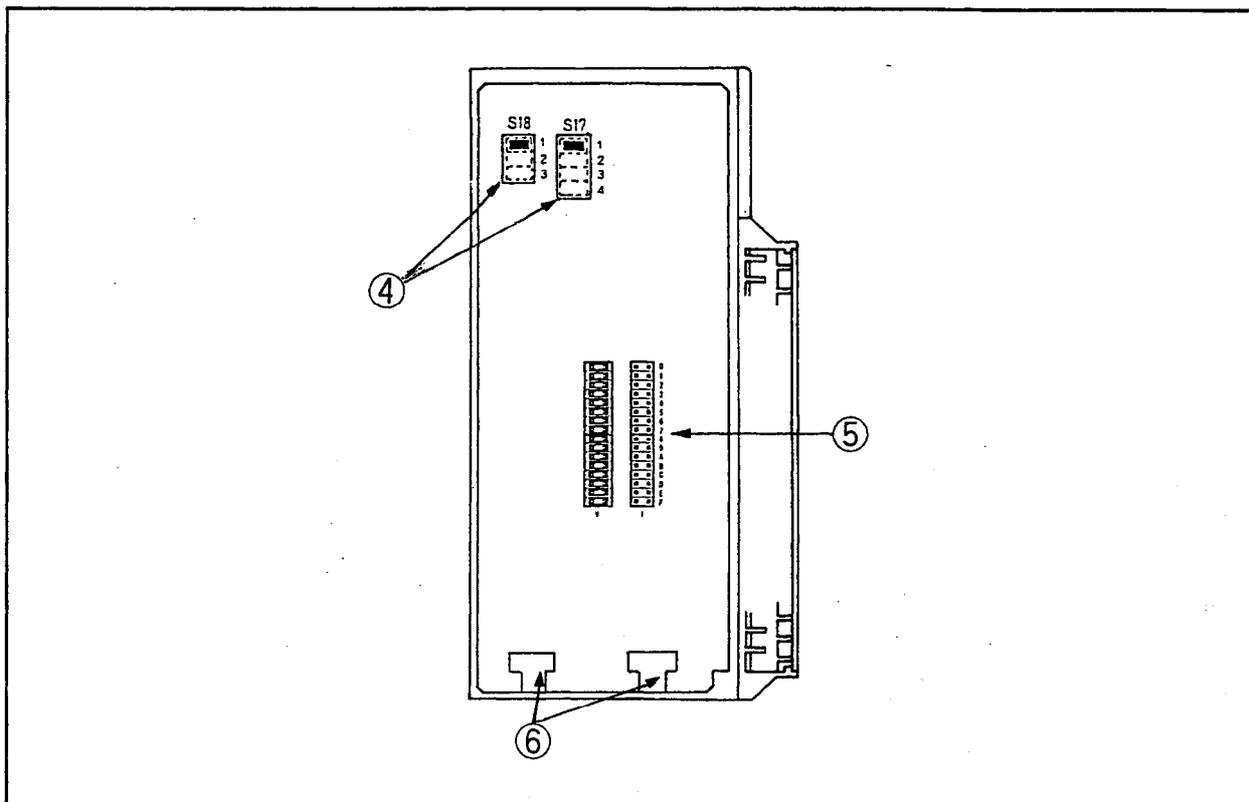

No.	Name and Appearance	Description
④	<p data-bbox="240 1084 512 1122">Offset/gain setting pins</p> 	<p data-bbox="671 1084 1418 1173">Set the S1 and S2 offset/gain setting pins in accordance with the analog input voltage/current range and the setting of the A616TD offset/gain setting pins.</p> <p data-bbox="671 1173 1418 1225">For further details, refer to Section 3.4.1 (2) , A60MX and A60MXR Input Characteristics.</p> <p data-bbox="671 1225 1418 1254">Set to "1" on shipment from factory.</p>
⑤	<p data-bbox="240 1397 576 1435">Analog input select switches</p> 	<p data-bbox="671 1397 1418 1449">Used to select the type of analog input (voltage or current) of each channel (CH 0 to F).</p> <p data-bbox="671 1449 1418 1478">OFF: Voltage input setting</p> <p data-bbox="671 1478 1418 1507">ON : Current input setting</p> <p data-bbox="671 1529 1418 1559">Set to OFF on shipment from factory.</p>
⑥	<p data-bbox="240 1839 555 1877">Extension cable connectors</p>	<p data-bbox="671 1839 1418 1928">For connection of an extension cable with an adjacent module when the A60MX, A60MXR or A60MXRN is further provided adjacent to the A60MXR to increase channels.</p> <p data-bbox="671 1928 1418 1957">The extension cable may be connected to either connector.</p>

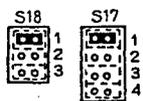

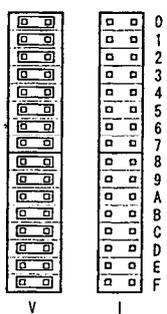

6.1.4 Description and settings of A60MXRN parts

Description and setting of A60MXRN parts.

No.	Name and Appearance	Description
①	<p><b>CONNECT NO. switch</b></p> <p>CONNECT NO.</p> 	<p>Used to specify to which input of the A616TD the A60MXRN output is connected.</p> <p>Setting range: 0 to 7</p>
②	<p><b>Offset control</b></p> <p>OFFSET</p> 	<p>Used to make microadjustments of the offset value, which is selected by the setting pins S17 and S18 in the module.</p> <p>For further details, refer to Section 6.1.5, Offset/Gain Settings.</p>
③	<p><b>Gain control</b></p> <p>GAIN</p> 	<p>Used to make microadjustments of the gain value, which is selected by the setting pins S17 and S18 in the module.</p> <p>For further details, refer to Section 6.1.5, Offset/Gain Settings.</p>

No.	Name and Appearance	Description
④	<p>Offset/gain setting pins</p> 	<p>Set the S17 and S18 offset/gain setting pins in accordance with the analog input voltage/current range and the setting of the A616TD offset/gain setting pins.                      For further details, refer to Section 3.4.1 (2), A60MX and A60MXR Input Characteristics.                      Set to "1" on shipment from factory.</p>
⑤	<p>Analog input select pins</p> 	<p>Used to select the type of analog input (voltage or current) of each channel (CH 0 to F).                      V position: Voltage input setting                      I position: Current input setting</p> <p>Factory-set in the V position.</p>
⑥	<p>Extension cable connectors</p>	<p>For connection of an extension cable with an adjacent module when the A60MX, A60MXR or A60MXRN is further provided adjacent to the A60MXRN to increase channels.                      The extension cable may be connected to either connector.</p>

6.1.5 Offset/Gain microadjustment

The relationship between analog input values and output values is determined by setting the offset/gain setting pins to select one of the predetermined I/O characteristics to suit the analog input range. The I/O characteristics set with the offset/gain setting pins differ slightly between modules depending on the ambient temperature and variations in A/D converter characteristics, etc. The modules are microadjusted in the factory to eliminate these slight differences.

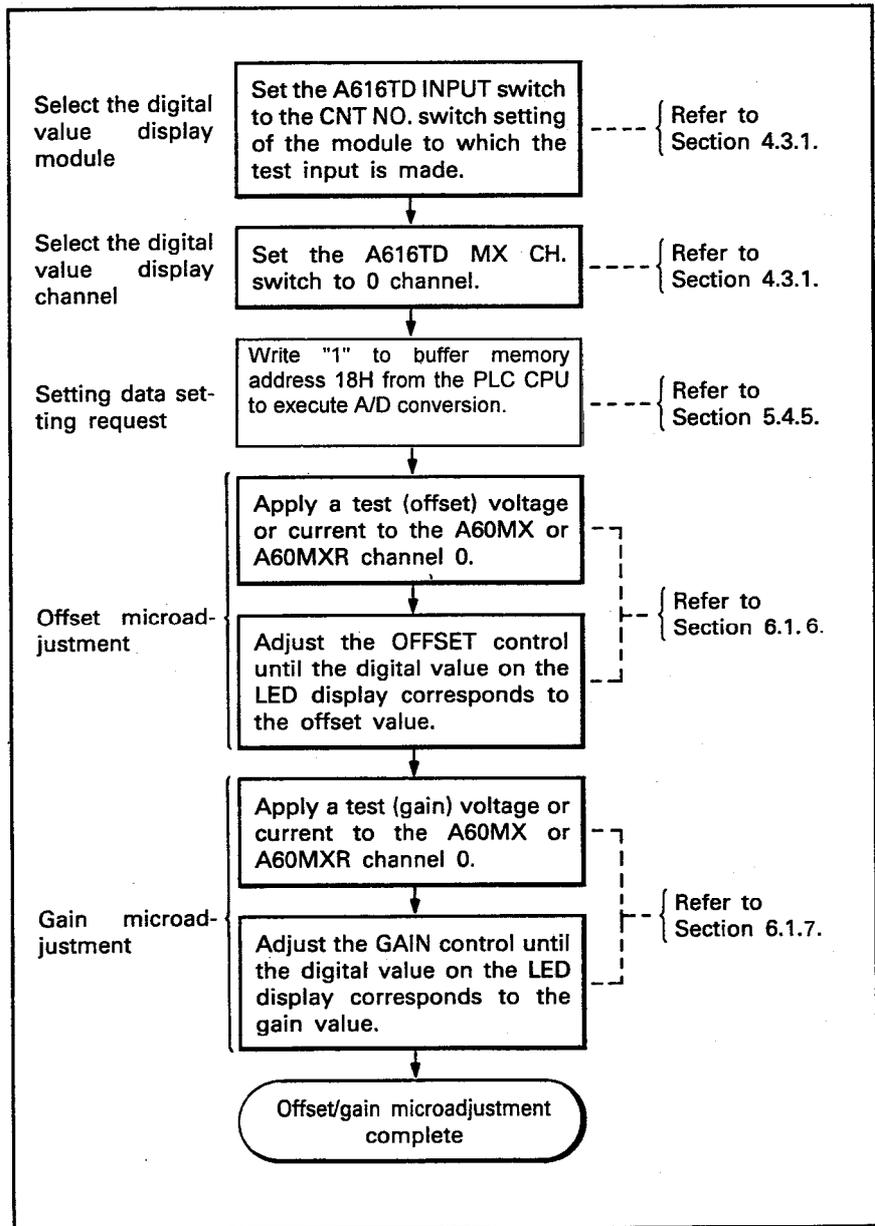

Fig. 6.1 Offset/Gain Microadjustment Procedure

### 6.1.6 Offset microadjustment

Carry out the microadjustment using the OFFSET control on the front of the module.

Apply a test voltage or current corresponding to the offset value of the I/O characteristic that was selected using the analog input select switch or analog input select pin and the offset/gain setting pins.

Adjust the OFFSET control until the digital value displayed on the LED's on the front of the module matches the digital value corresponding to the analog test voltage or current being input.

A60MX, A60MXR, A60MXRN		A60MX, A60MXR or A60MXRN Analog Input Select Switch/Pin Position			
Offset/gain setting pin setting		V			
S2 (S17*)	S1 (S18*)	Test voltage (V)	Digital value	Test current (mA)	Digital value
1	1	0	0	0	0
2	1	0	0	0	0
3	2	1	0	4	0
4	3	0	2000	0	2000
1	3	0	2000	0	2000

\*For A60MXRN

Table 6.1 A60MX, A60MXR and A60MXRN Test Voltages, Currents and Digital Values

#### Example

When the A60MX, A60MXR or A60MXRN offset/gain setting pin S2 (S17) is set to "2" and S1 (S18) to "1" and the analog input select switch or analog input select pin of channel 0 of the A60MX, A60MXR or A60MXRN is set to the "V" position. Input a test voltage of 0V to channel 0 of the A60MX, A60MXR or A60MXRN and adjust the OFFSET potentiometer of the A60MX, A60MXR or A60MXRN until the digital value of the LED display on the A616TD reaches "0".

### 6.1.7 Gain microadjustment

Carry out the microadjustment using the GAIN control on the front of the module.

Apply a test voltage or current corresponding to the gain value of the I/O characteristic that was selected using the analog input select switch or analog input select pin and the offset/gain setting pins.

Adjust the GAIN control until the digital value displayed on the LED's on the front of the module matches the digital value corresponding to the analog test voltage or current being input.

A60MX, A60MXR, A60MXRN		A60MX, A60MXR or A60MXRN Analog Input Select Switch/Pin Position			
Offset/gain setting pin setting		V			
S2 (S17*)	S1 (S18*)	Test voltage (V)	Digital value	Test current (mA)	Digital value
1	1	0	0	0	0
2	1	0	0	0	0
3	2	1	0	4	0
4	3	0	2000	0	2000
1	3	0	2000	0	2000

\*For A60MXRN

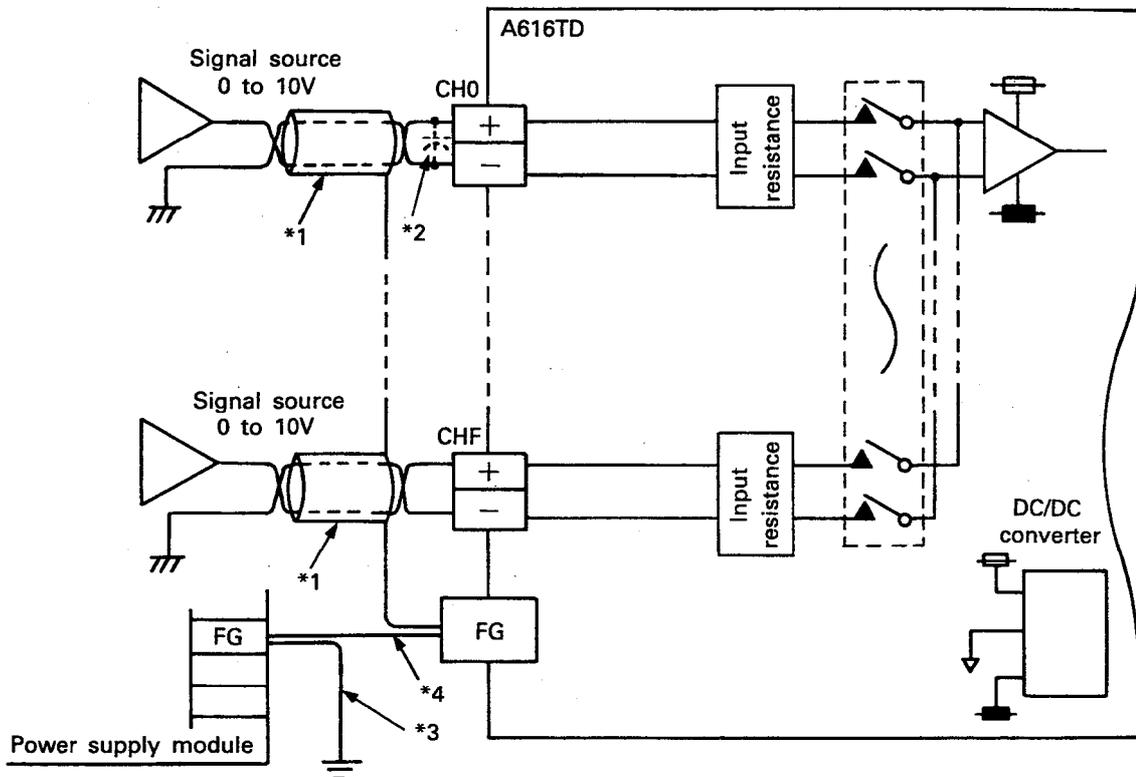

Table 6.2 A60MX, A60MXR and A60MXRN Test Voltages, Currents and Digital Values

#### Example

When the A60MX, A60MXR or A60MXRN offset/gain setting pin S2 (S17) is set to "1" and S1 (S18) to "1" and the analog input select switch or analog input select pin of channel 0 of the A60MX, A60MXR or A60MXRN is set to the "V" position. Input a test voltage of 10V to channel 0 of the A60MX, A60MXR or A60MXRN and adjust the GAIN potentiometer of the A60MX, A60MXR or A60MXRN until the digital value of the LED display on the A616TD reaches "4000".

## 6.1.8 Wiring instructions

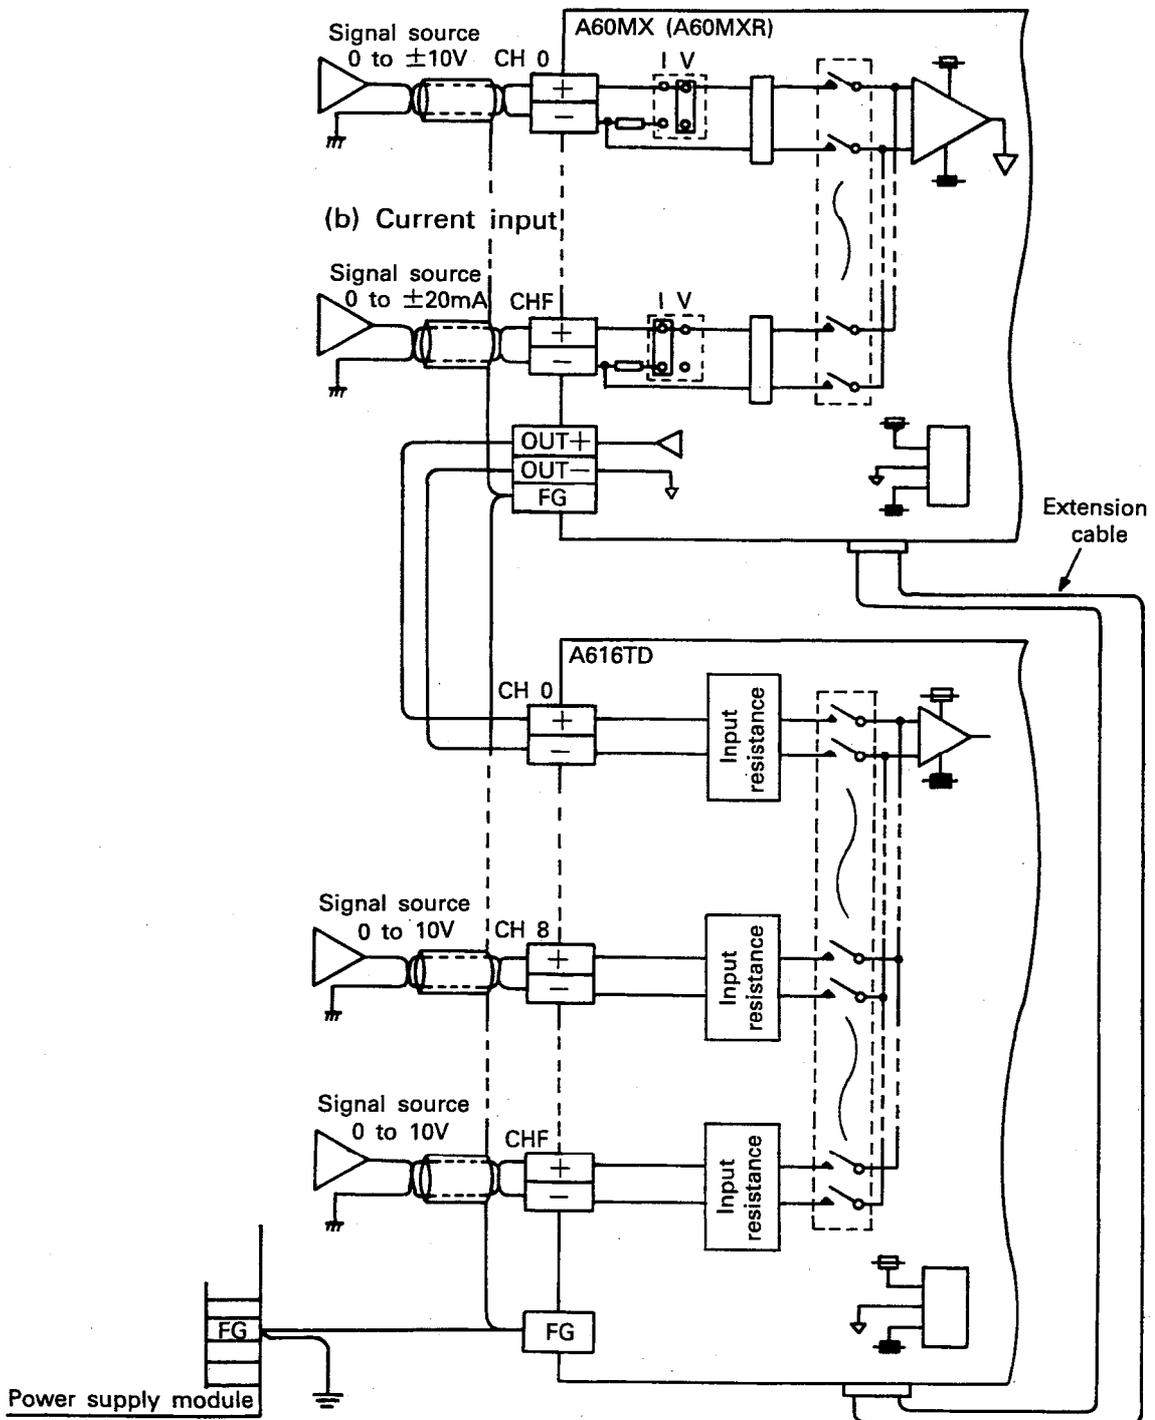

- (1) Wiring example for a stand-alone A616TD module  
An example of a voltage input for the A616TD is shown below.

- \*1 Use only two-core twisted shield wire.
- \*2 If noise or ripple is generated in the external wiring, connect an approx. 0.1 to 0.47  $\mu$ F 25WV capacitor between the + and - terminals.
- \*3 The FG terminals of the power supply module must be grounded.
- \*4 Always connect the A616TD FG terminal to the power supply module FG terminal.

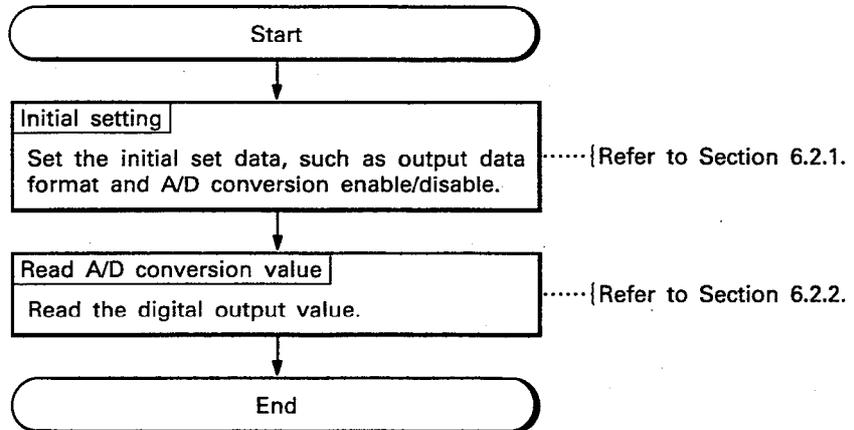

- (2) Wiring example for an A616TD connected to an A60MX or A60MXR module  
 Examples are shown below for voltage and current inputs to the A616TD connected to an A60MX or A60MXR module.

(a) Voltage input

**6.2 Programming Procedure**

An A616TD analog/digital conversion program is written according to the following procedure:

**POINT**

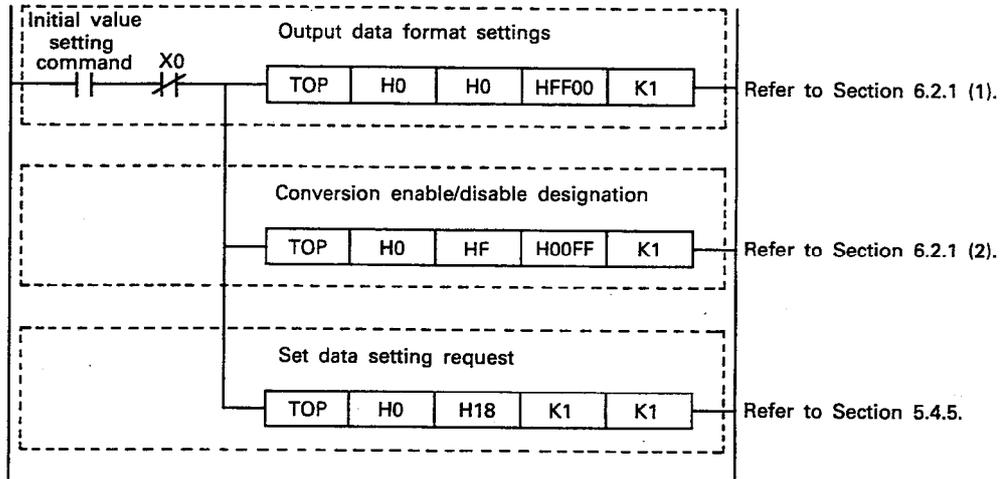

**During each of the processes of the special function module, access from the PLC CPU will have priority.**

**Accordingly, if frequent access to the buffer memory of the special function module made from the PLC CPU, it will not only extend the scan time of the PLC CPU, delays in each of the processes of the special function module will occur.**

**Only use the FROM/TO and other such commands to access the buffer memory from the PLC CPU when necessary.**

6.2.1 Initial setting

The initial setting program shown below must be included before any program to read digital output values.

In cases where a combination of temperature/digital conversion and analog/digital conversion is to be carried out, write both the initial data for the temperature/digital conversion and that for the analog/digital conversion to the buffer memory and then finally execute the set data setting request once only.

- (1) Setting the data format Set the A/D conversion output data format (whether the output values are to be in the form -48 to 4057 or -2048 to 2047) for each A616TD INPUT channel and write the data to the buffer memory address "0."
  - (a) Default values are written to address 0H to set the "-48 to 4047" data format for all INPUT channels when the power supply is turned on or the PLC CPU reset.

(b) The 16-bit configuration of the memory area is shown below.

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
INPUT															
F	E	D	C	B	A	9	8	7	6	5	4	3	2	1	0

Address 0<sub>H</sub>

0: -48 to 4047 data format  
1: -2048 to 2047 data format

(c) The data format is fixed at the -48 to 4047 data format for INPUT channels to which a A616TD module is attached. Any other set data for these channels is ignored.

**POINT**

No setting is required if the -48 to 4047 data format is to be used for all INPUT channels.

(2) Specifying A/D conversion enable/disable

Write "0" or "1", respectively, to the buffer memory addresses F<sub>H</sub> to 17<sub>H</sub> to disable or enable A/D conversion for each A616TD, A60MX and A60MXR channel.

Refer to Section 5.4.2 if the modules are to connected to A60MXT to carry out both temperature/digital conversion and analog/digital conversion.

(a) Default values are written when the power supply is turned on or the PLC CPU reset to enable conversion for all channels.

(b) The 16-bit configuration of the memory area is shown below.

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
CH.F	CH.E	CH.D	CH.C	CH.B	CH.A	CH.9	CH.8	CH.7	CH.6	CH.5	CH.4	CH.3	CH.2	CH.1	CH.0

0: Conversion disabled  
1: Conversion enabled

(c) The setting area of buffer memory addresses F<sub>H</sub> to 17<sub>H</sub> is configured as follows.

Address

F <sub>H</sub>	A616TD INPUT 0 to F	Channel conversion enable/disable setting area
10 <sub>H</sub>	CNT. No. 0 MX CX. 0 to F	Channel conversion enable/disable setting area
11 <sub>H</sub>	CNT. No. 1 MX CX. 0 to F	Channel conversion enable/disable setting area
12 <sub>H</sub>	CNT. No. 2 MX CX. 0 to F	Channel conversion enable/disable setting area
13 <sub>H</sub>	CNT. No. 3 MX CX. 0 to F	Channel conversion enable/disable setting area
14 <sub>H</sub>	CNT. No. 4 MX CX. 0 to F	Channel conversion enable/disable setting area
15 <sub>H</sub>	CNT. No. 5 MX CX. 0 to F	Channel conversion enable/disable setting area
16 <sub>H</sub>	CNT. No. 6 MX CX. 0 to F	Channel conversion enable/disable setting area
17 <sub>H</sub>	CNT. No. 7 MX CX. 0 to F	Channel conversion enable/disable setting area

**POINT**

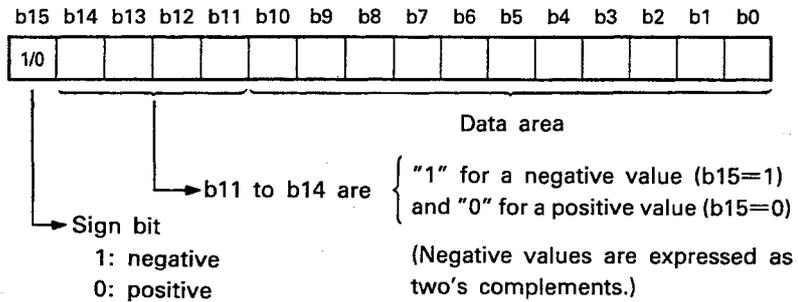

- (1) The sampling period decreases the more the number of channels for which A/D conversion is enabled.
- (2) "0" (conversion disable) is automatically written to the area for channels which are not connected to A60MX.

6.2.2 Reading the digital output values

The analog values input to the A616TD, A60MX and A60MXR channels are sampled and A/D conversion carried out for each channel. The digital output values are stored for each channel in the buffer memory.

The digital output value can be read by the PLC CPU for any channel by specifying the buffer memory address.

- (1) Two types of area are used to store the digital output values: the A616TD INPUT channel storage area and A60MX and A60MXR MX CH. channel storage area.
- (2) The 16-bit configuration of both types of memory area is shown below.

- (3) The data stored in the INPUT channel storage area differs depending on whether the channel is connected to an external sensor or to an A60MX or A60MXR module.
  - (a) If an external sensor is connected  
 The digital value converted from the analog value input from the external sensor is stored in the memory area.
  - (b) If an A60MX or A60MXR module is connected  
 The digital value converted from the analog value input from the external sensor connected to the MX CH. 0 channel of the A60MX or A60MXR is stored in the memory area.

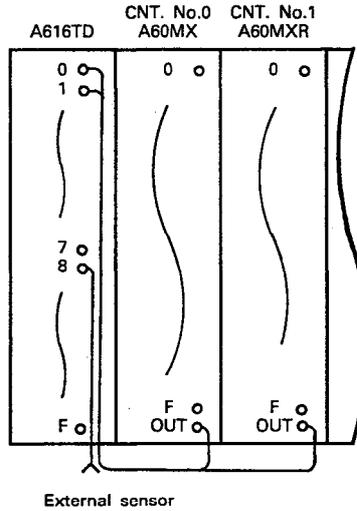

Address

70 <sub>H</sub>	INPUT 0 digital output value
71 <sub>H</sub>	INPUT 1 digital output value
72 <sub>H</sub>	INPUT 2 digital output value
73 <sub>H</sub>	INPUT 3 digital output value
74 <sub>H</sub>	INPUT 4 digital output value
75 <sub>H</sub>	INPUT 5 digital output value
76 <sub>H</sub>	INPUT 6 digital output value
77 <sub>H</sub>	INPUT 7 digital output value
78 <sub>H</sub>	INPUT 8 digital output value
79 <sub>H</sub>	INPUT 9 digital output value
7A <sub>H</sub>	INPUT A digital output value
7B <sub>H</sub>	INPUT B digital output value
7C <sub>H</sub>	INPUT C digital output value
7D <sub>H</sub>	INPUT D digital output value
7E <sub>H</sub>	INPUT E digital output value
7F <sub>H</sub>	INPUT F digital output value

The relationship between the area addresses and channel numbers is as follows:

Example

A60MX and A60MXR modules are connected to channels 0 and 1 of the A616TD and an external sensor is connected to channel 8.

The data is stored in the addresses as follows:

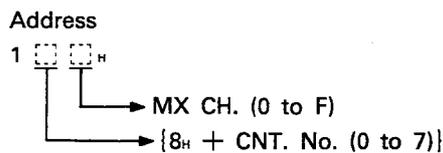

- Address 70<sub>H</sub>: digital value from channel 0 of the A60MX connected to CNT. NO. 0.
- Address 71<sub>H</sub>: digital value from channel 0 of the A60MXR connected to CNT. NO. 1.
- Address 78<sub>H</sub>: digital value A/D converted from the analog value received from the external sensor.

(4) Digital values A/D converted from the analog values received from external sensors connected to the A60MX and A60MXR channels are stored in the MX CH. channel storage area for each channel.

Address

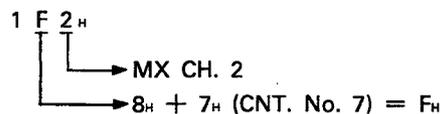

180 <sub>H</sub>	CNT. No. 0	MX CH. 0	Digital output value
181 <sub>H</sub>		MX CH. 1	Digital output value
182 <sub>H</sub>		MX CH. 2	Digital output value
to		⋮	
18F <sub>H</sub>		MX CH. F	Digital output value
190 <sub>H</sub>	CNT. No. 1	MX CH. 0	Digital output value
191 <sub>H</sub>		MX CH. 1	Digital output value
192 <sub>H</sub>		MX CH. 2	Digital output value
to		⋮	
19F <sub>H</sub>		MX CH. F	Digital output value
to	⋮		
1F0 <sub>H</sub>	CNT. No. 7	MX CH. 0	Digital output value
1F1 <sub>H</sub>		MX CH. 1	Digital output value
1F2 <sub>H</sub>		MX CH. 2	Digital output value
to		⋮	
1FF <sub>H</sub>		MX CH. F	Digital output value

The relationship between the area addresses and channel numbers is as follows:

Example

Address of MX CH. 2 of the CNT NO. 7 A60MXR module:

6.2.3 Reading error codes

When the A616TD detects an error, the corresponding error code is stored in buffer memory address 1H as a binary code.

- (1) The stored error code is upgraded each time an error is detected, and the previous value is cleared.
- (2) If an error occurs which results in an error code from 01 to 04, "1" is written to the bit of the buffer memory address 2H which corresponds to the CNT NO. of the faulty module. "1" is written to this address for the appropriate CNT. NO. each time a new error occurs, and this date remains stored until the area is cleared.

1) The 16-bit configuration of the memory area is shown below.

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
CNT.No.															
F	E	D	C	B	A	9	8	7	6	5	4	3	2	1	0

0: Normal  
 1: Discontinuity or out-of-range

6.2.4 Clearing the error code area

- (1) This data remains stored in buffer memory after the causes of the faults have been corrected. Write "0" to the buffer memory addresses 1H and 2H with a sequence program to clear the error data.

7. TROUBLESHOOTING

7.1 Error Code List

When an error occurs during use of the A616TD and A60MXT/A60MX/A60MXR, the corresponding error code is indicated on the LED display. The error code is a 16-bit binary and is written to the error code area (address 1<sub>H</sub>).

The table of error codes is shown below.

Type	Error Code	Description	A616TD Operation	"RUN" LED	Error-Check Timing
Card data error	01, 07	(1) Multiplexer module is faulty or incorrectly loaded. (2) Extension cable is faulty or incorrectly connected.	A/D conversion is not executed.	Off	When power turned on
Multiplex module removed	02	Error when one of the following occurs during A/D conversion: (1) Multiplex module removed from base. (2) Extension cable disconnected from module. (3) Positions of discontinuity detection enable /disable setting pins or measurement range setting pins changed after power supply turned on. (4) A60MX, A60MXR or A60MXT CONNECT NO. switch setting changed after power supply turned on.	Processing stops.	Off	Always
CONNECT NO. switch setting error	03	CNT. NO. switch of any multiplex module has been set to a position other than 0 to 7.	Module set to other than 0-7: A/D conversion is not executed. Module set to 0-7: Processing continues.	Off	When power turned on
Measurement range setting error	04	A60MXT measurement range set to value other than 1 to 4.	Modules set to value other than 1 to 4: A/D conversion is not executed. Modules set to value 1 to 4: processing continues.	Flicker	When power turned on
Buffer memory write disable error	10	Data has been written from the PLC CPU to the buffer memory read-only area. (Addresses 4 <sub>H</sub> , 70 to 7F <sub>H</sub> , 180 to 27F <sub>H</sub> )	Processing continues.	Flicker	On TO instruction execution
Set data setting request error	12	The value written to the buffer memory set data setting request area is not "1".	At initial setting: A/D conversion is not executed. During A/D conversion: Processing continues under previous conditions.	Flicker	On TO instruction execution
	13	"1" continuously written to the buffer memory set data setting request area with the TO instruction during A/D conversion.			
Buffer memory transfer error	30	A/D conversion data cannot be written to the buffer memory due to an excess of FROM and TO instructions.	Processing continues.	Flicker	Always
Thermocouple type setting error	70	The thermocouple type written to buffer memory has a value other than 1 to 8.	Channels set to value other than 1 to 8: Processing interrupted. Channels set to value 1 to 8: processing continues.	Flicker	On a set data setting request

Table 7.1 Error Code List

**POINT**

(1) To clear the error code area (address 1<sub>H</sub>), write 0 from the PLC CPU. (For details, see Section 5.12 and 6.2.4.)

(2) The buffer memory data at the occurrence of any error is retained.

## 7.2 Troubleshooting

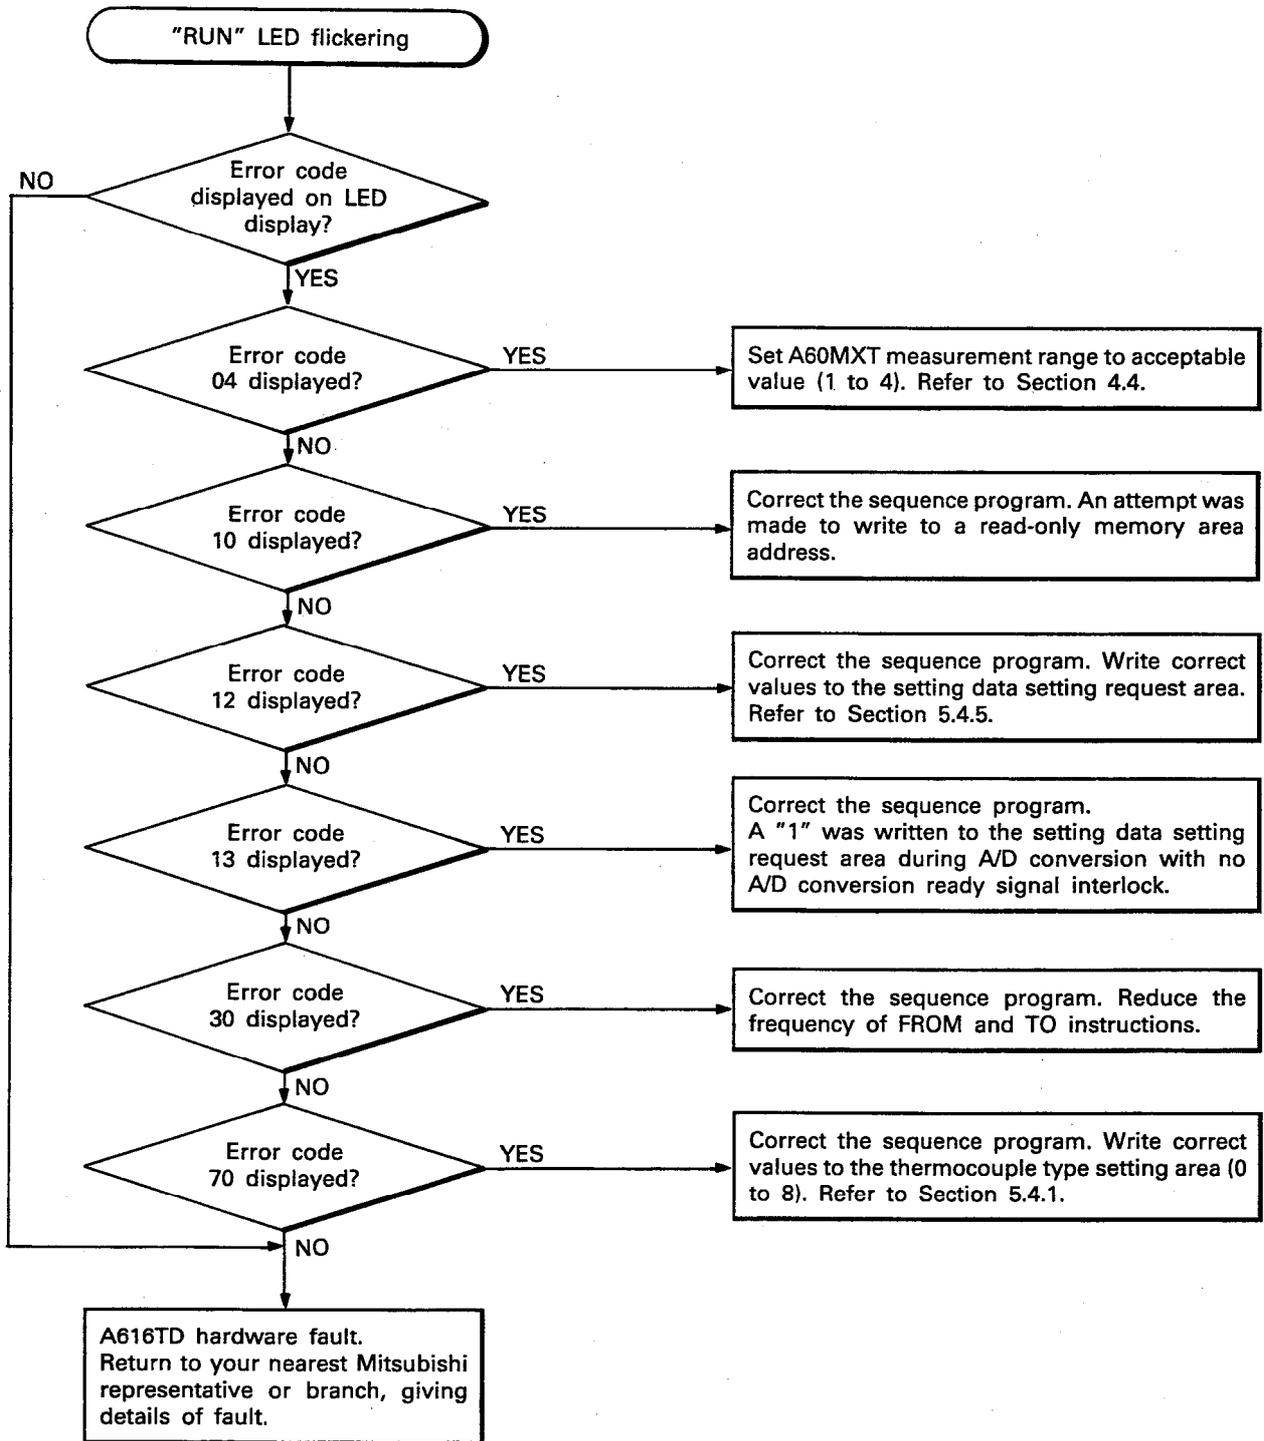

Troubleshooting procedures for use of the A616TD are given below. For problems relating to the CPU module, see the corresponding CPU module user's manual.

### 7.2.1 General troubleshooting

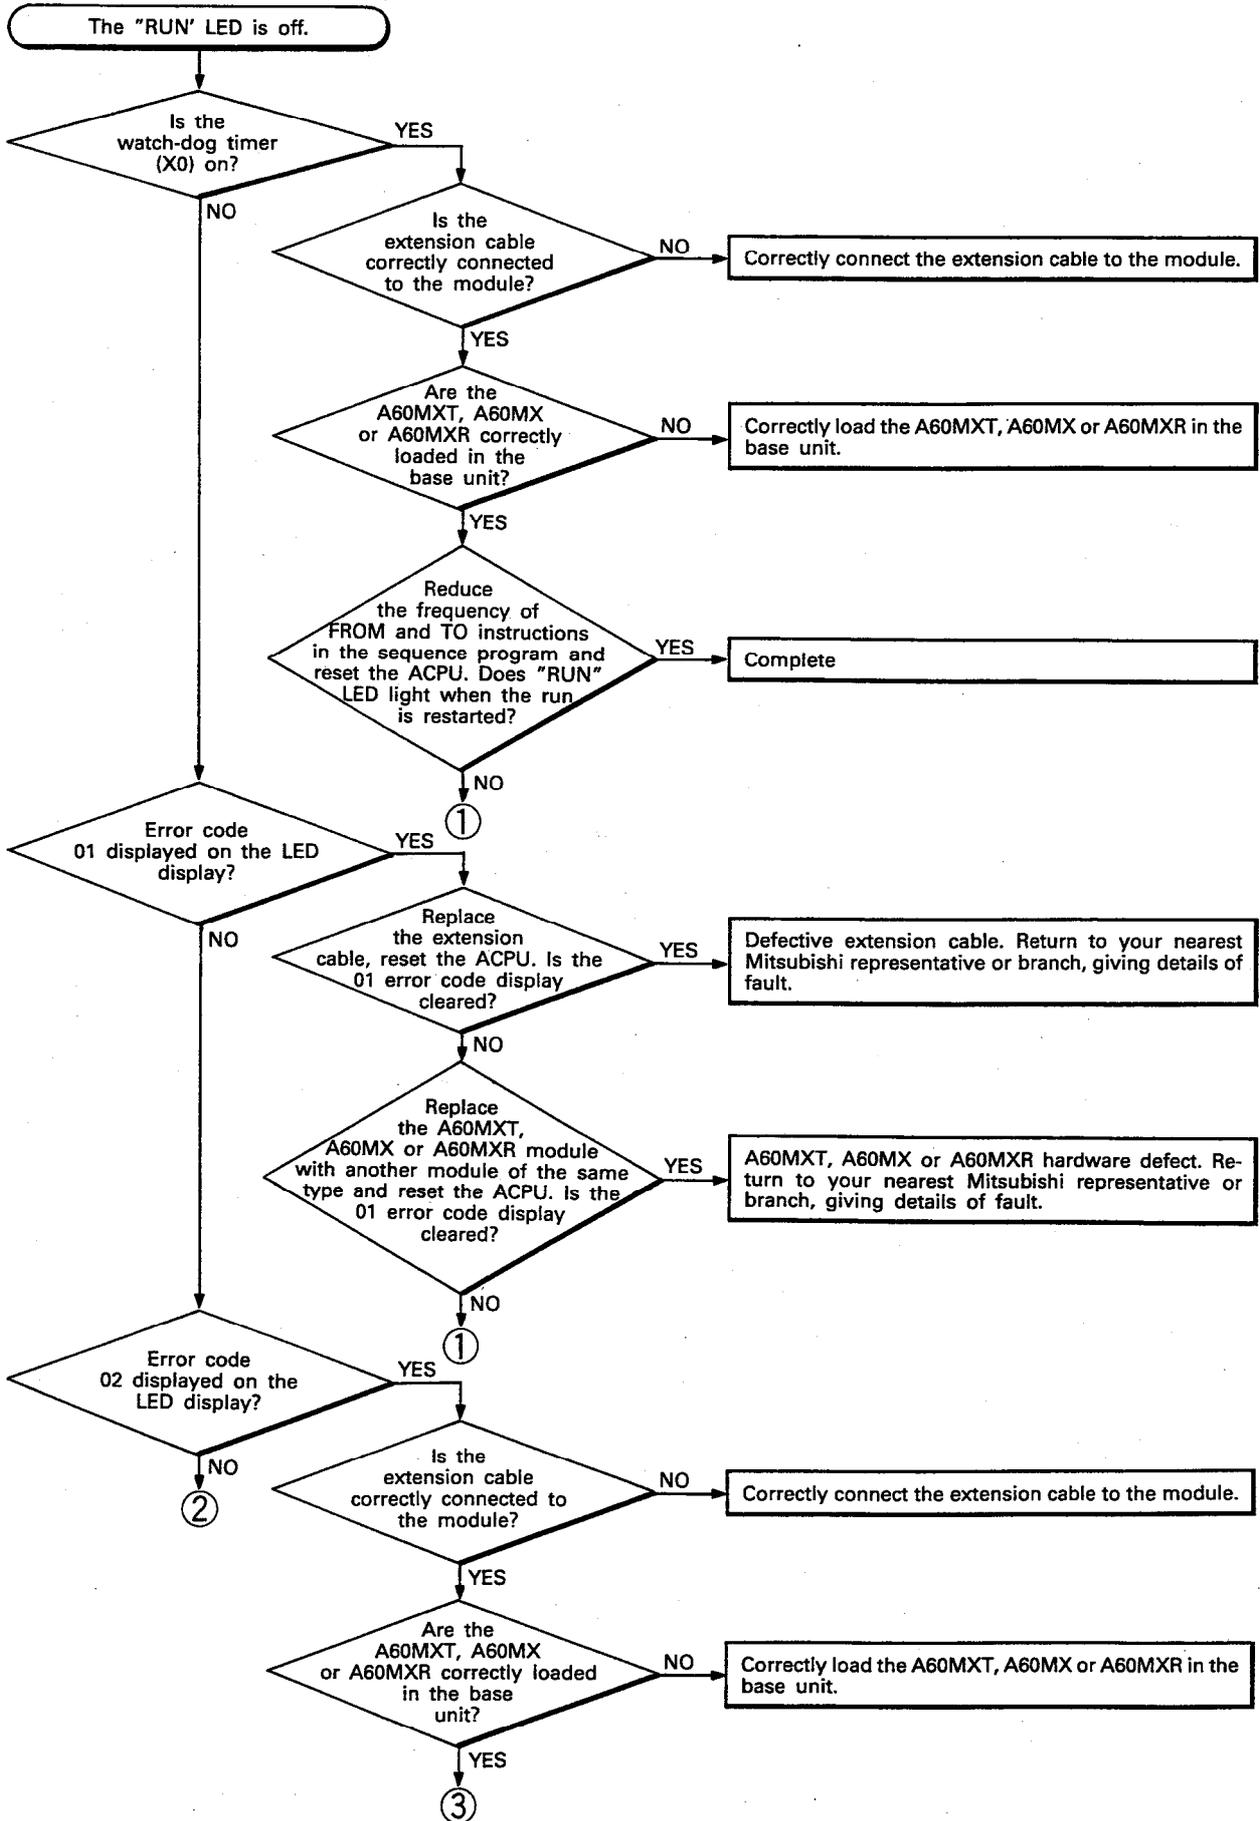

Symptom		Remedy
<b>(1) "RUN" LED status</b>		
"RUN" LED flickering	⇒	Section 7.2.2
"RUN" LED off	⇒	Section 7.2.3
<b>(2) CPU module status</b>		
Error code in special register D9008	⇒	Section 7.2.4
CPU module in "SP. UNIT DOWN"	⇒	Section 7.2.5
CPU module in "SP. UNIT ERROR"	⇒	Section 7.2.6
CPU module in "CONTROL-BUS ERR."	⇒	Section 7.2.7
Digital value unreadable from CPU.	⇒	Section 7.2.8
<b>(3) A616TD-CPU module input signal status</b>		
Watch-dog timer (WDT) error signal (X0) is on.	⇒	Section 7.2.9
A/D conversion ready signal (X1) is on.	⇒	Section 7.2.10
Discontinuity error detected signal (X3) or detected temperature output value out-of-range signal (X5) is on.	⇒	Section 7.2.11
Digital output value out-of-range error detected signal (X4) is on.	⇒	Section 7.2.12
Detected temperature value LED display request signal (Y10) is on.	⇒	Section 7.2.13

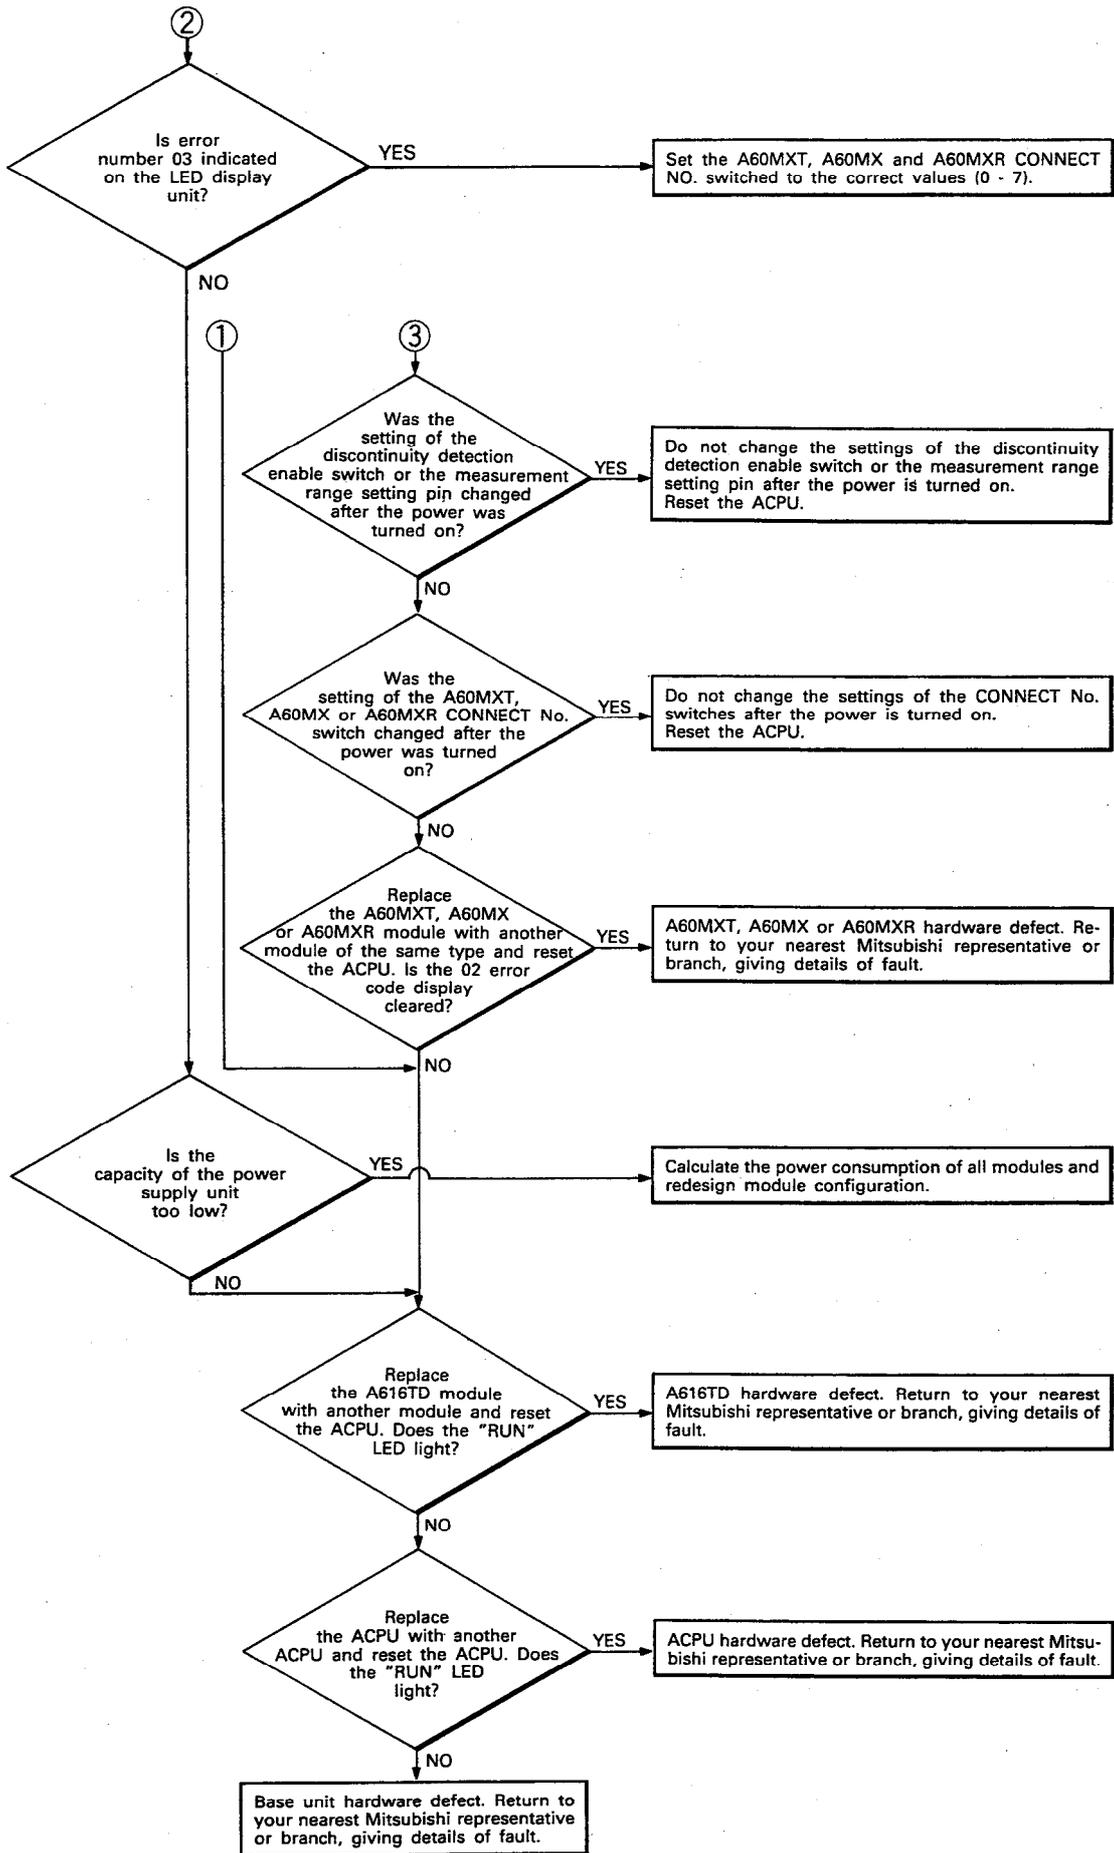

Symptom	Remedy
<b>(4) A616TD LED display status</b>	
Rapid fluctuations of digital output value during temperature sensor input.	 Section 7.2.14
Rapid fluctuations of digital output value during analog input.	 Section 7.2.15
Error code indicated on the LED display.	 Section 7.2.16
<b>(5) A616TD A/D conversion status</b>	
No correlation between temperature sensor input value and digital output value.	 Section 7.2.17
No correlation between analog input value and digital output value.	 Section 7.2.18
Constant digital output value deviation from reference value during temperature sensor input.	 Section 7.2.19
Constant digital output value deviation from reference value during analog input.	 Section 7.2.20
Error compensation is abnormal.	 Section 7.2.21

7.2.2 "RUN" LED flickering

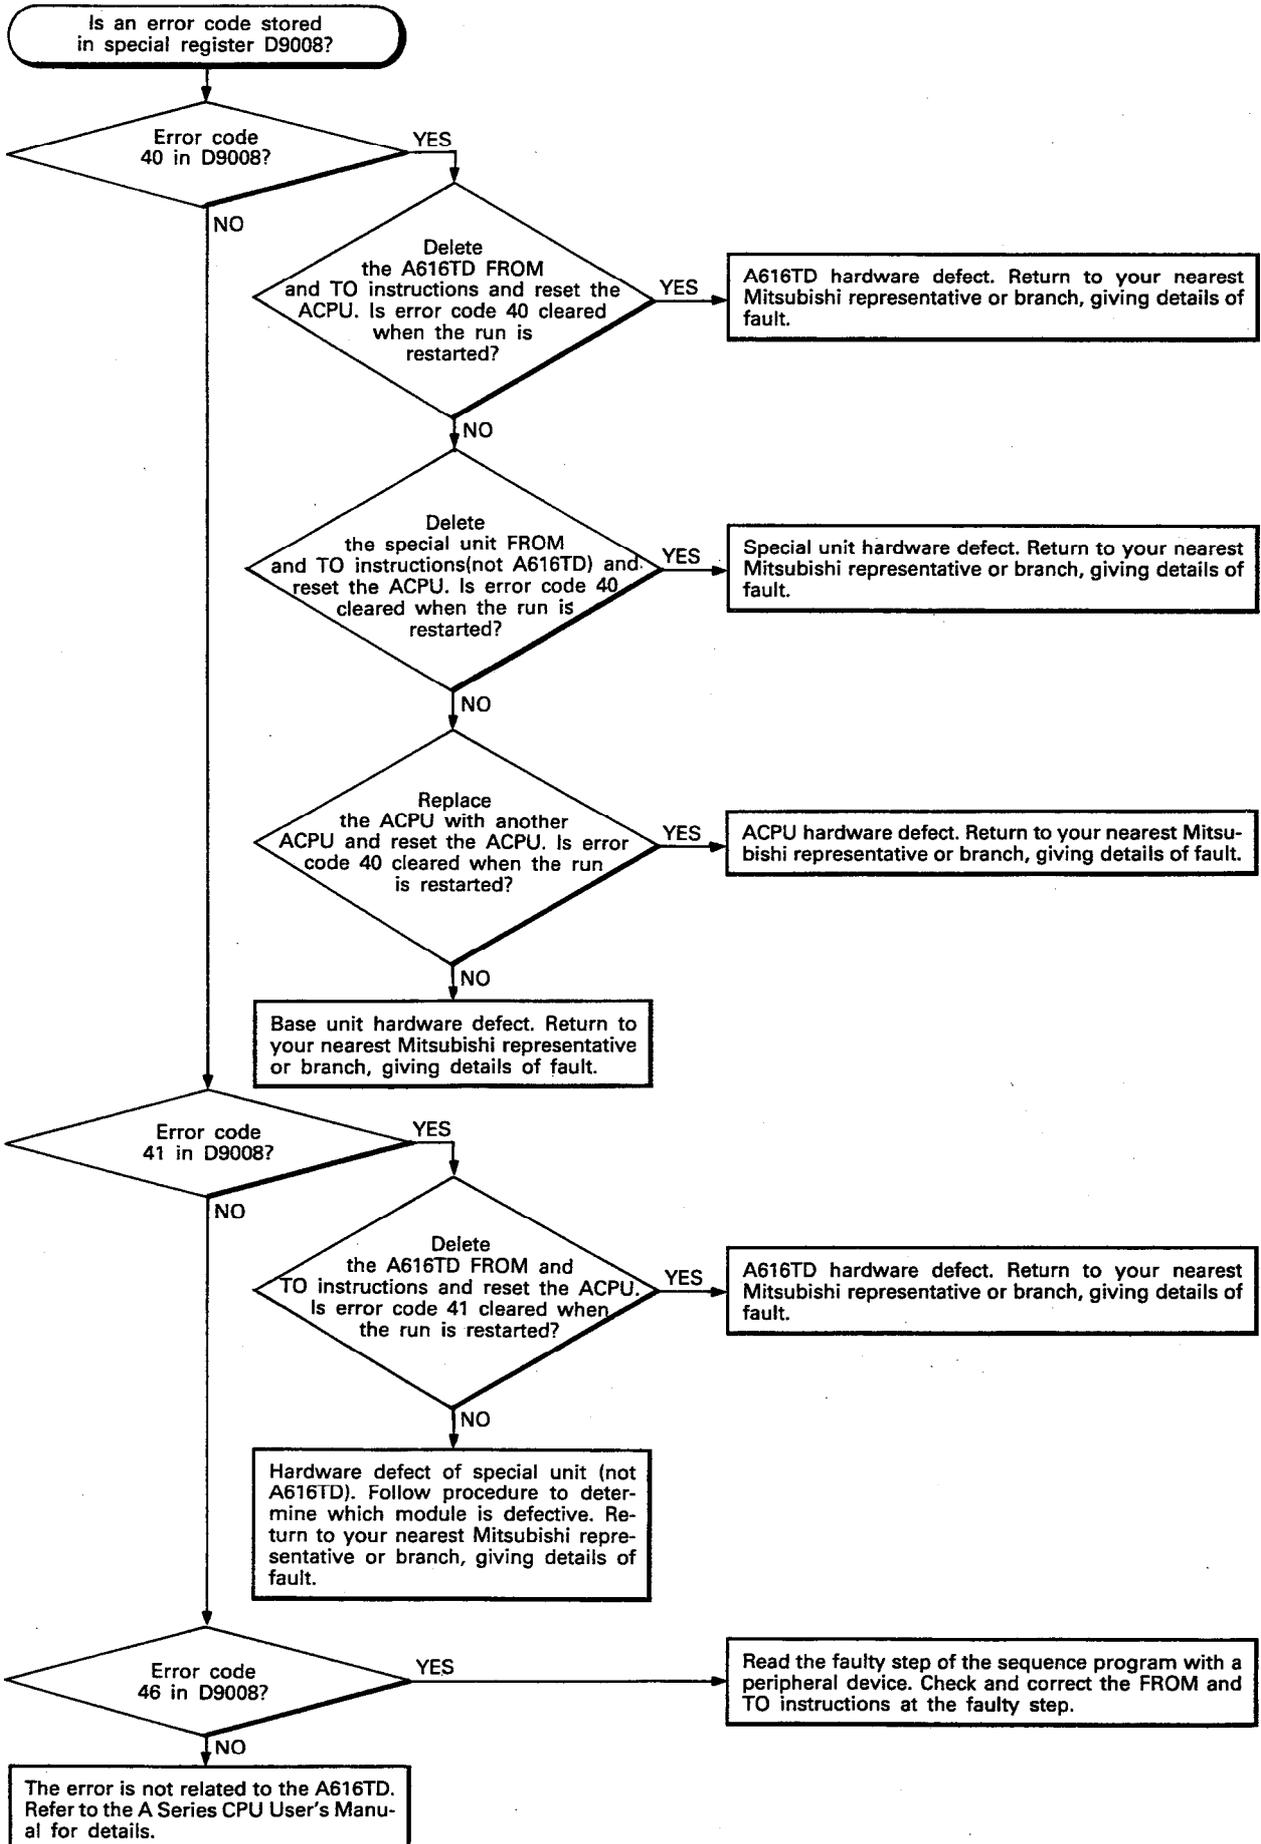

7.2.3 "RUN" LED off

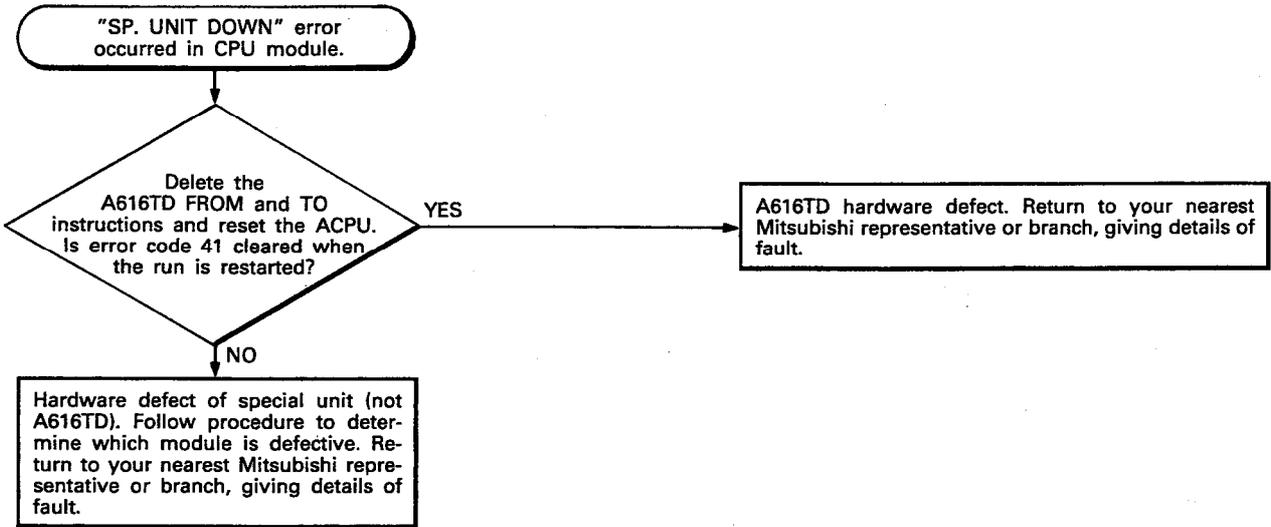

7.2.4 Error code in special register D9008

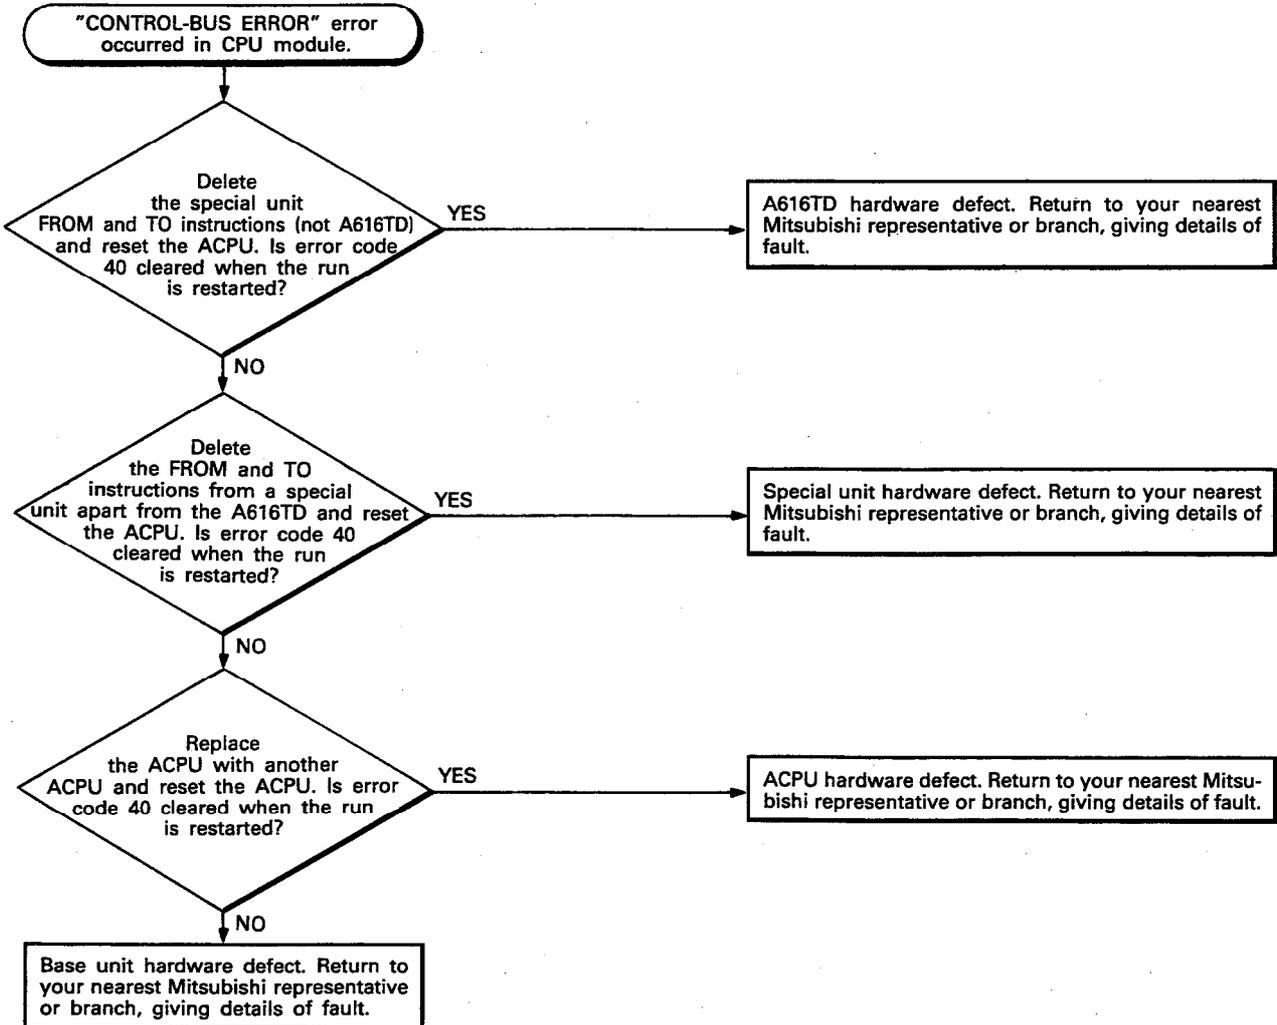

7.2.5 CPU module "SP. UNIT DOWN" error

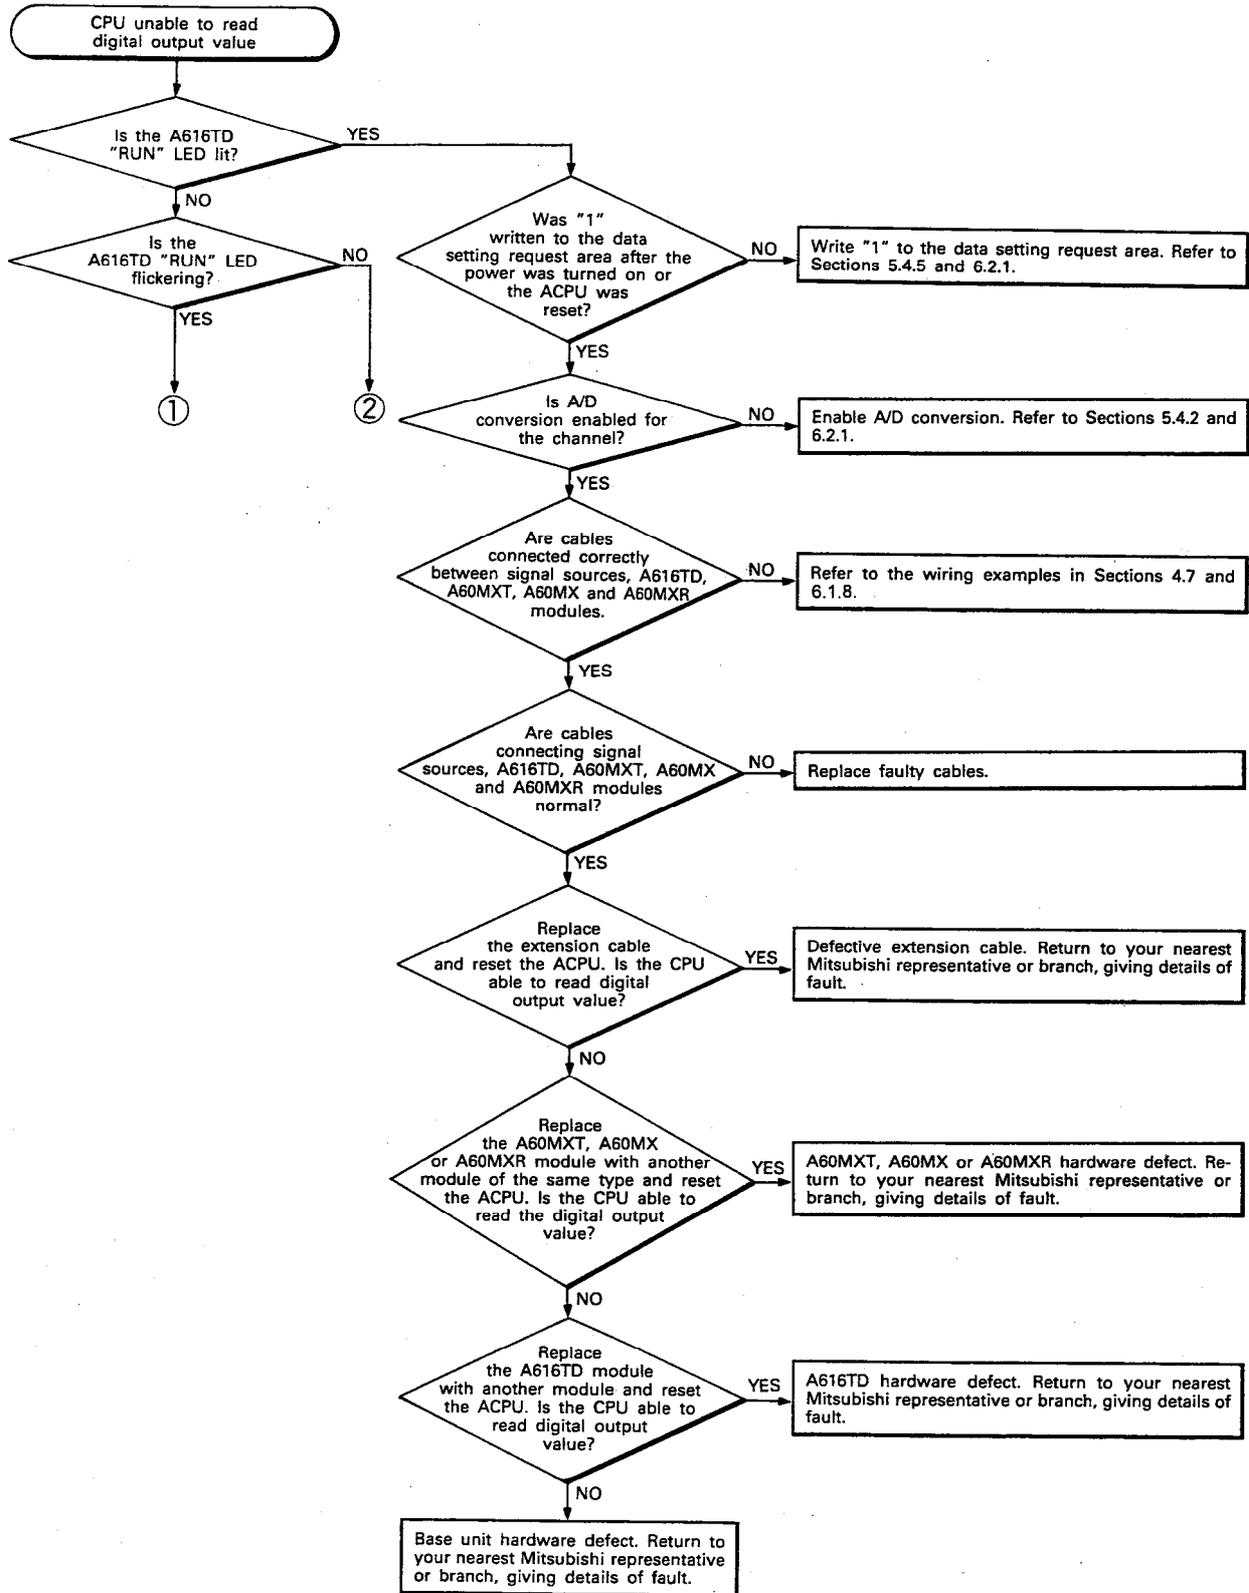

7.2.6 CPU module "SP. UNIT ERROR" error

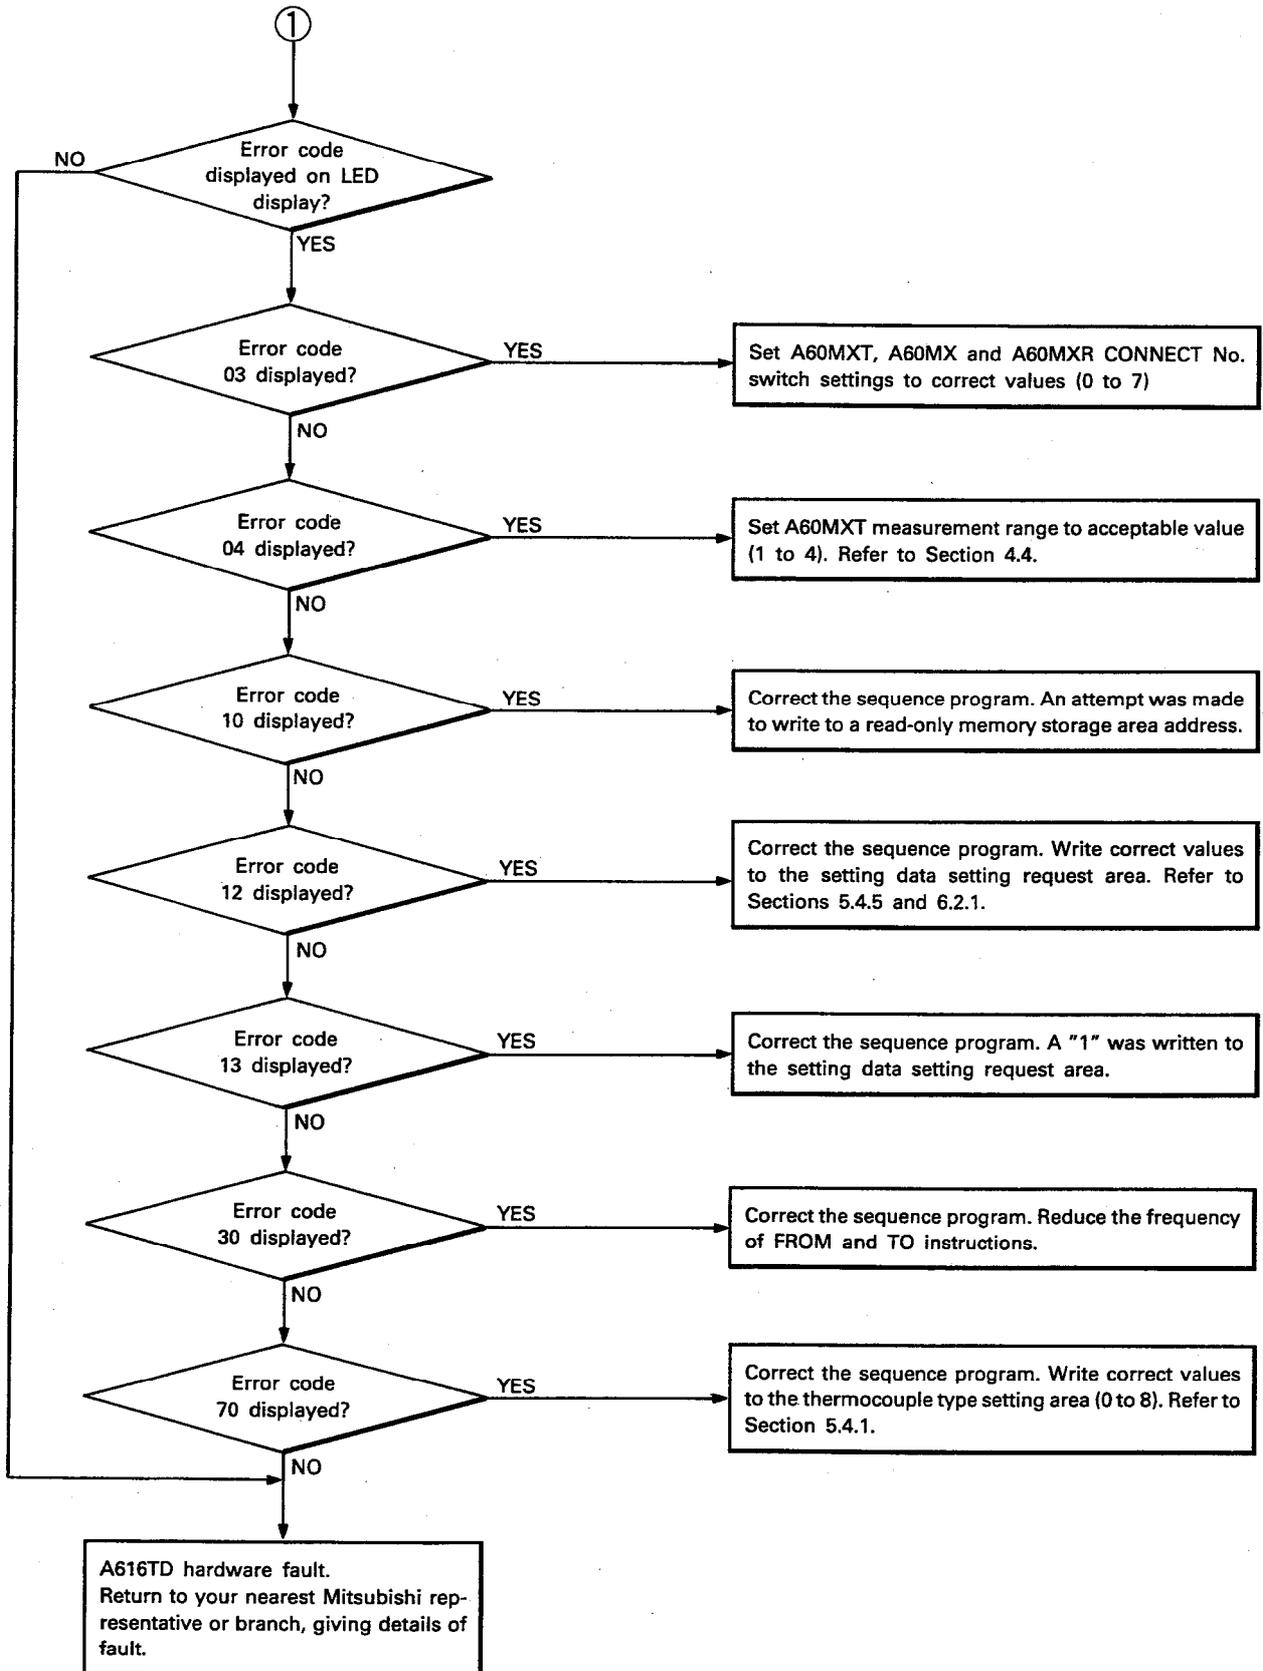

Read the faulty step of the sequence program with a peripheral device. Check and correct the FROM and TO instructions at the faulty step.

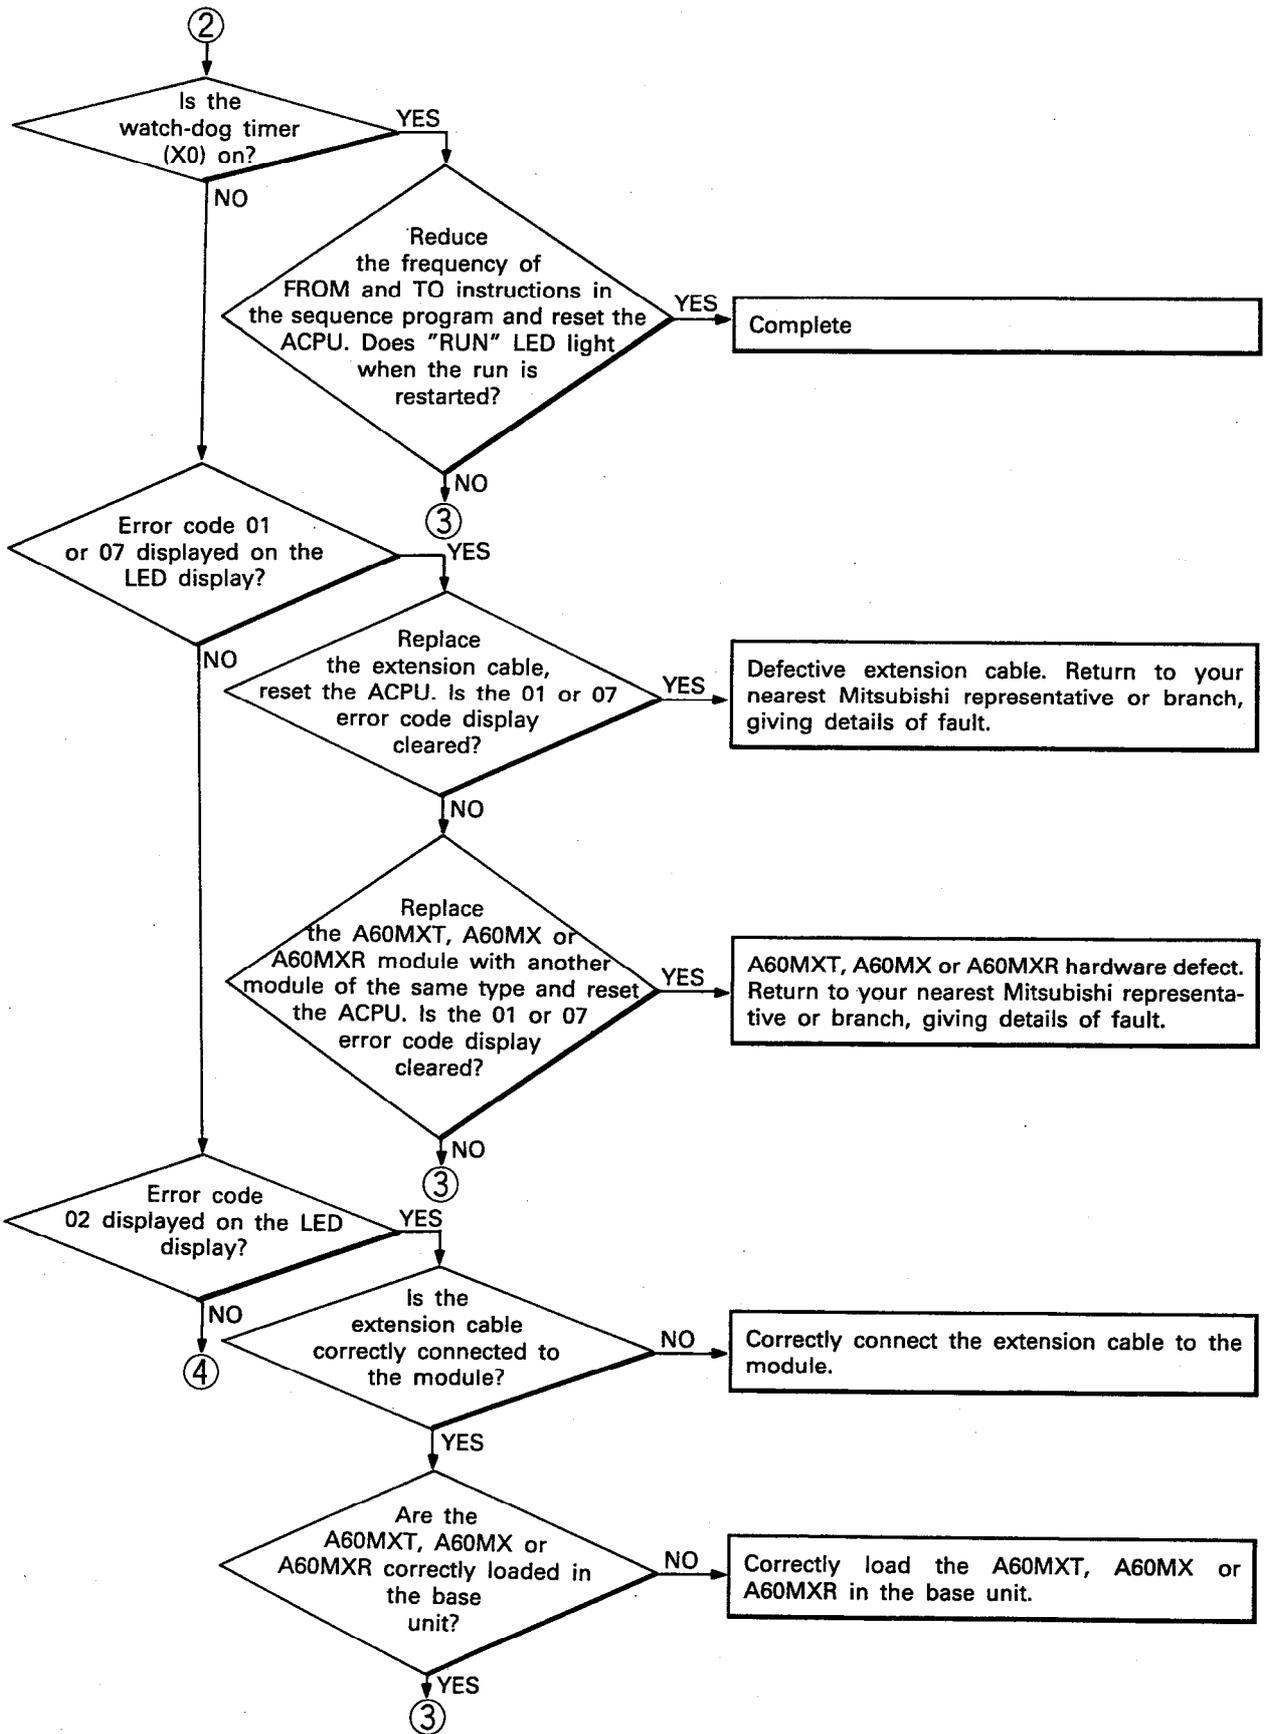

7.2.7 CPU module "CONTROL-BUS ERROR" error

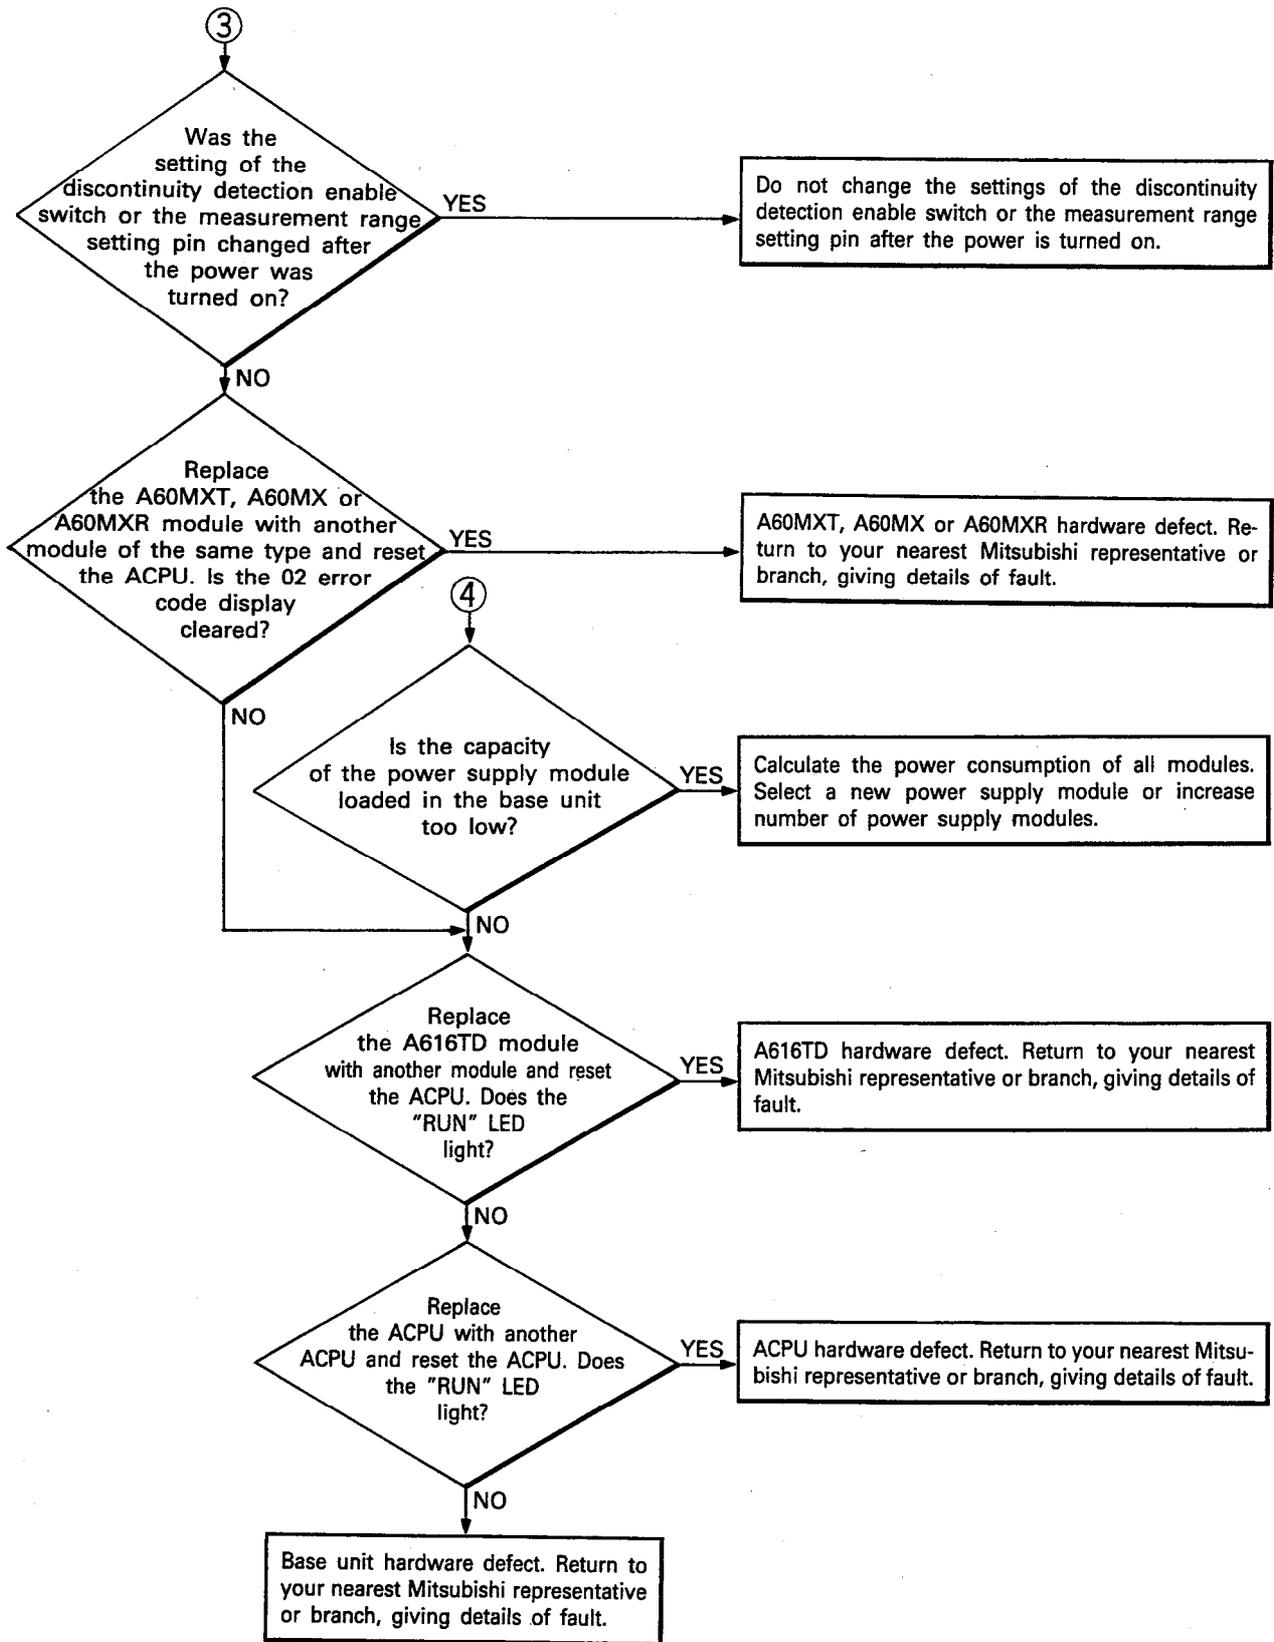

7.2.8 CPU unable to read digital output value

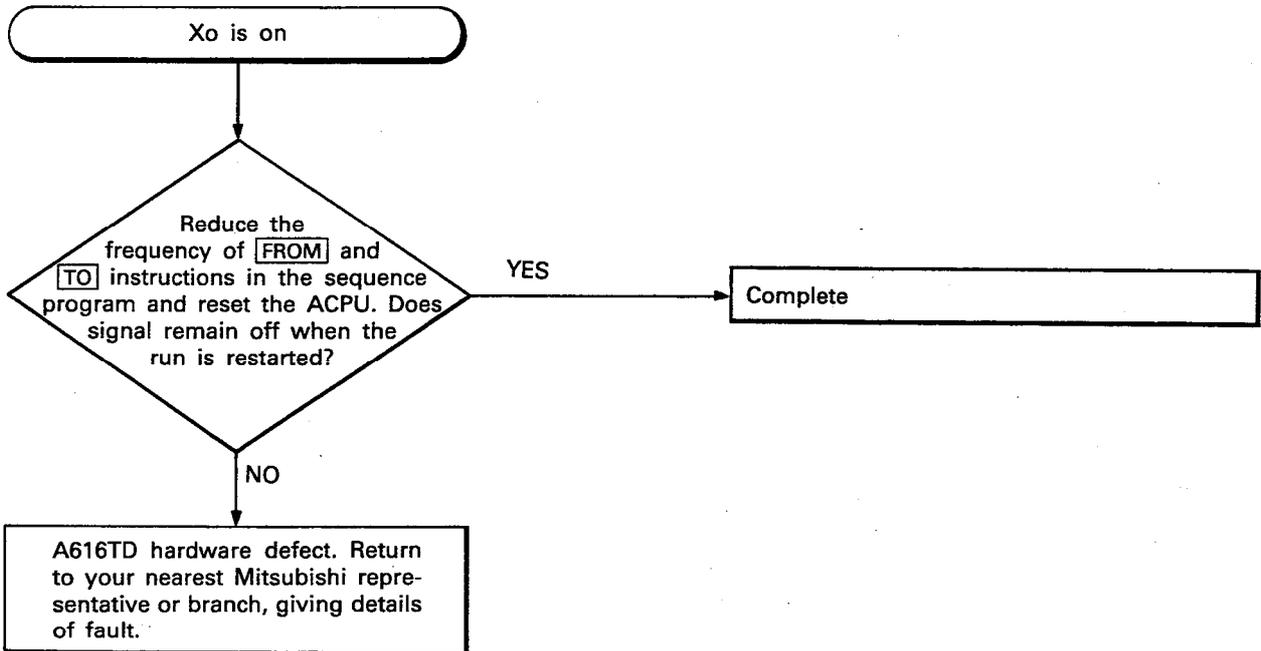

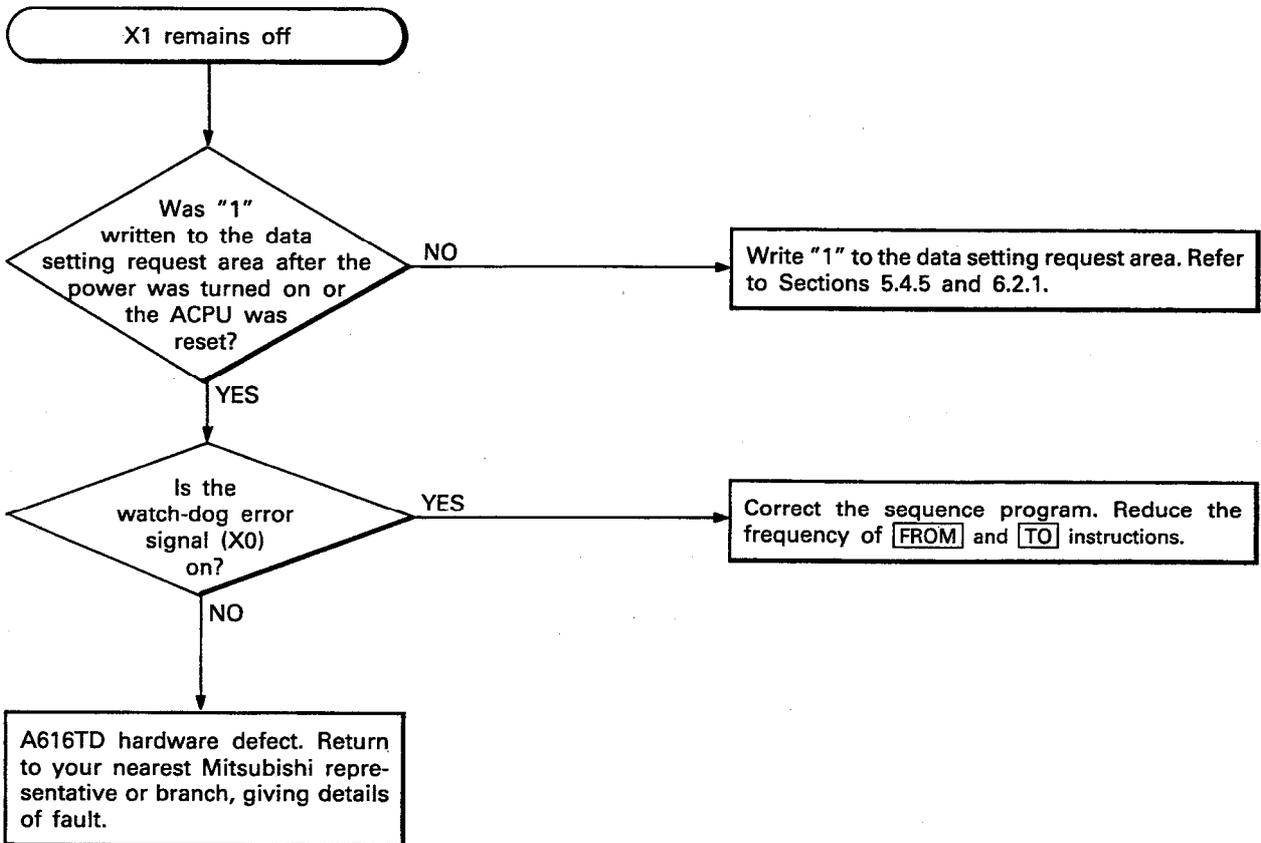

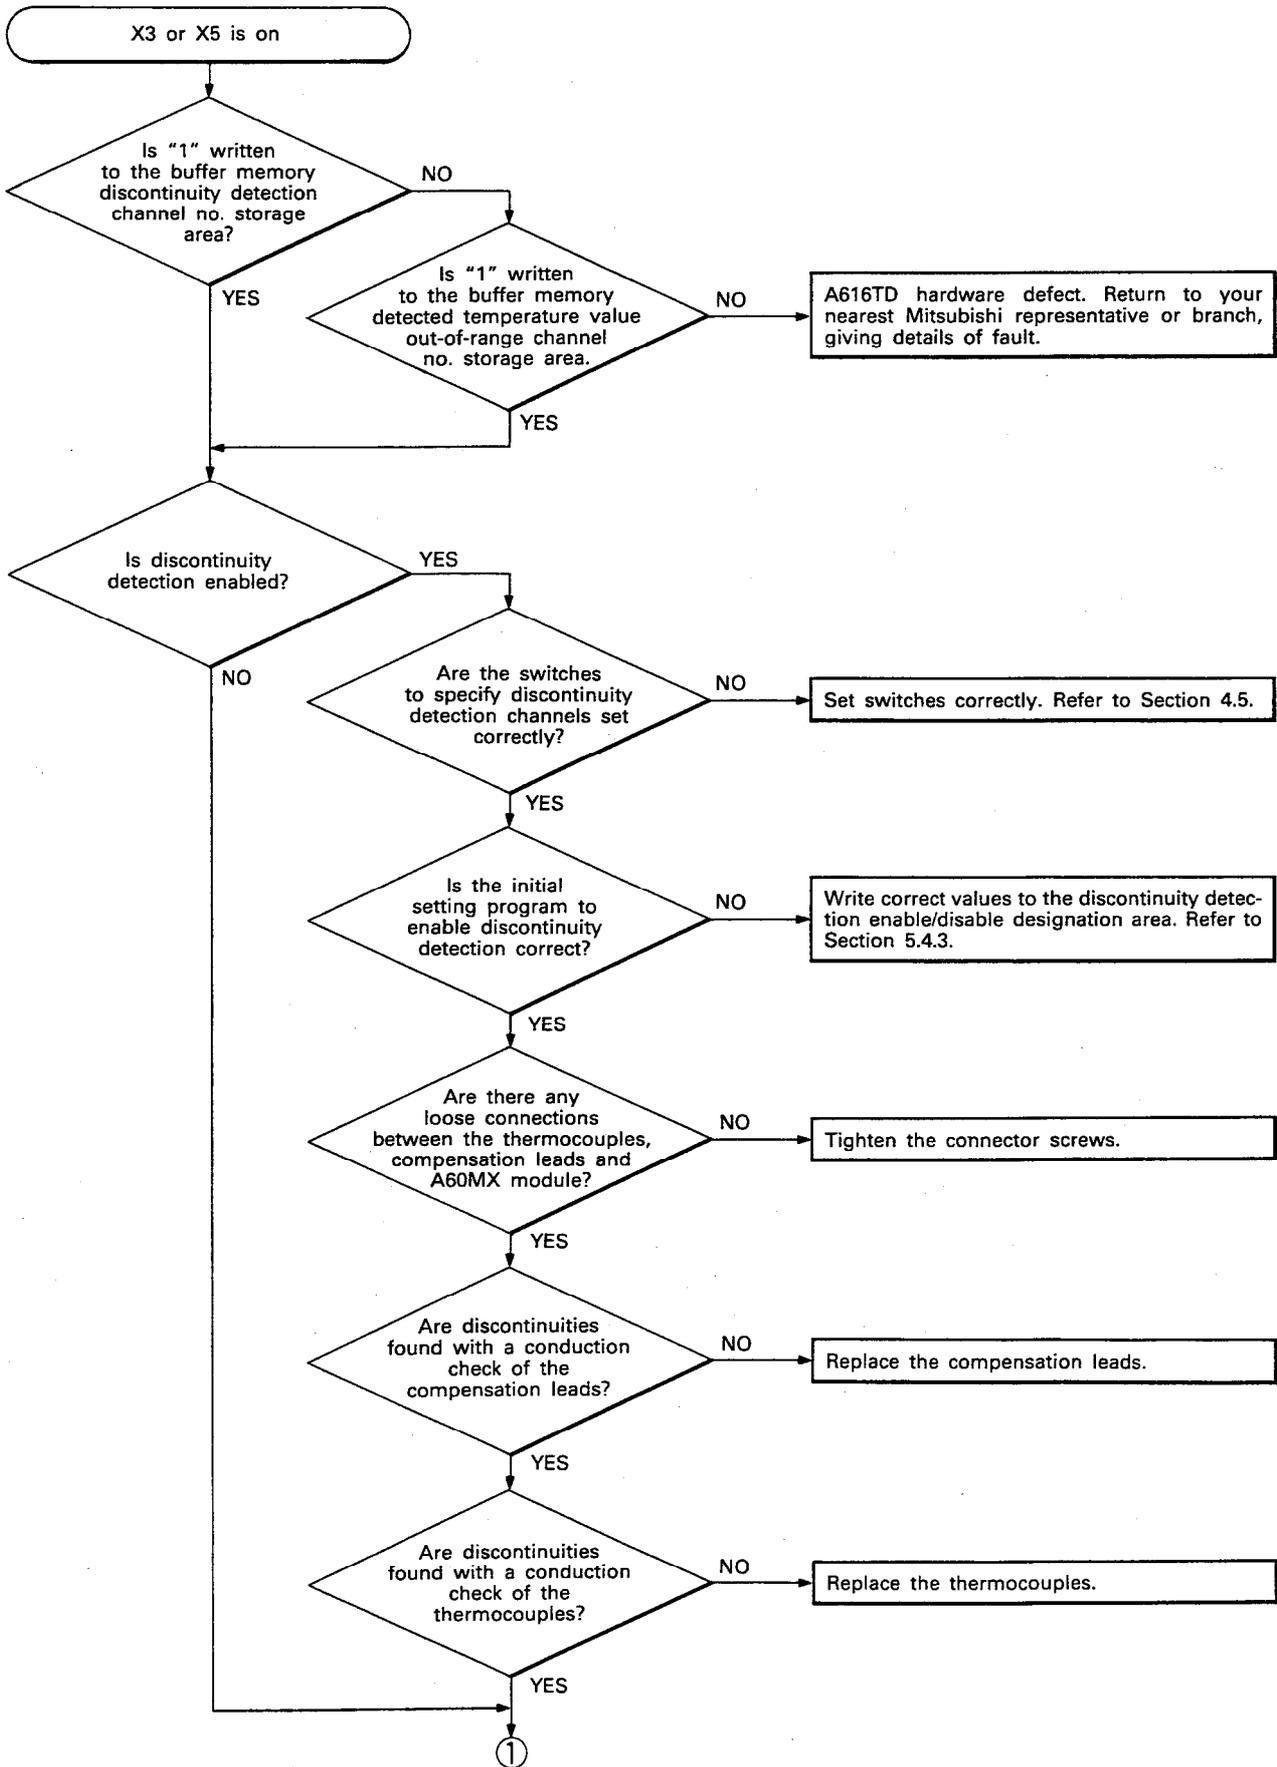

7.2.9 Watch-dog timer (WDT) error signal (X0) on

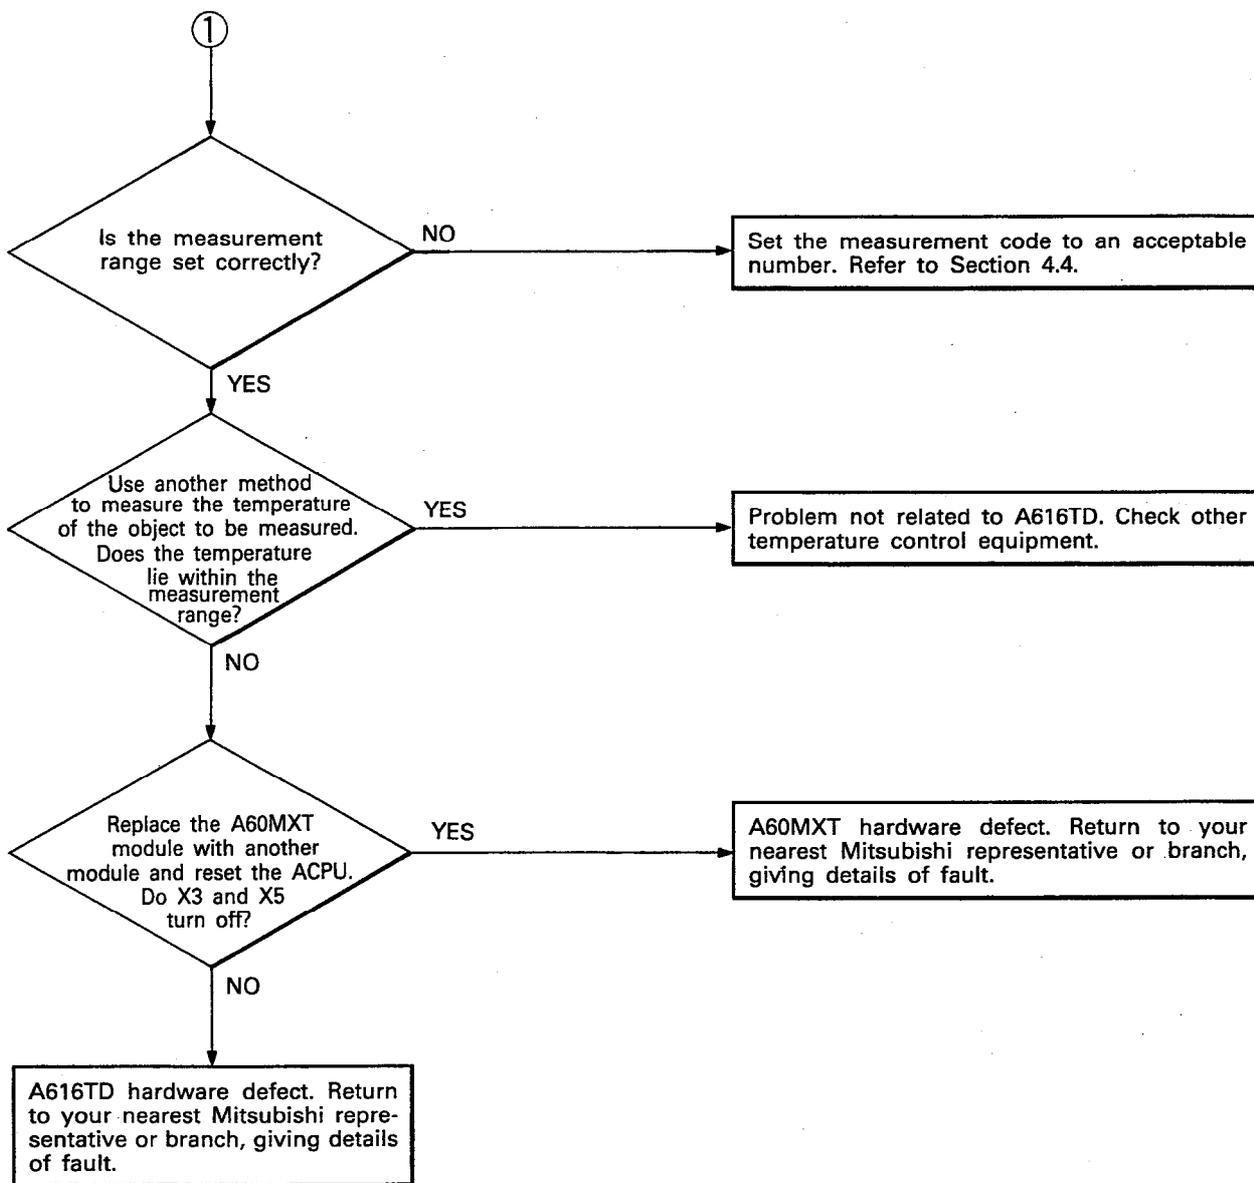

7.2.10 READY signal (X1) remains off

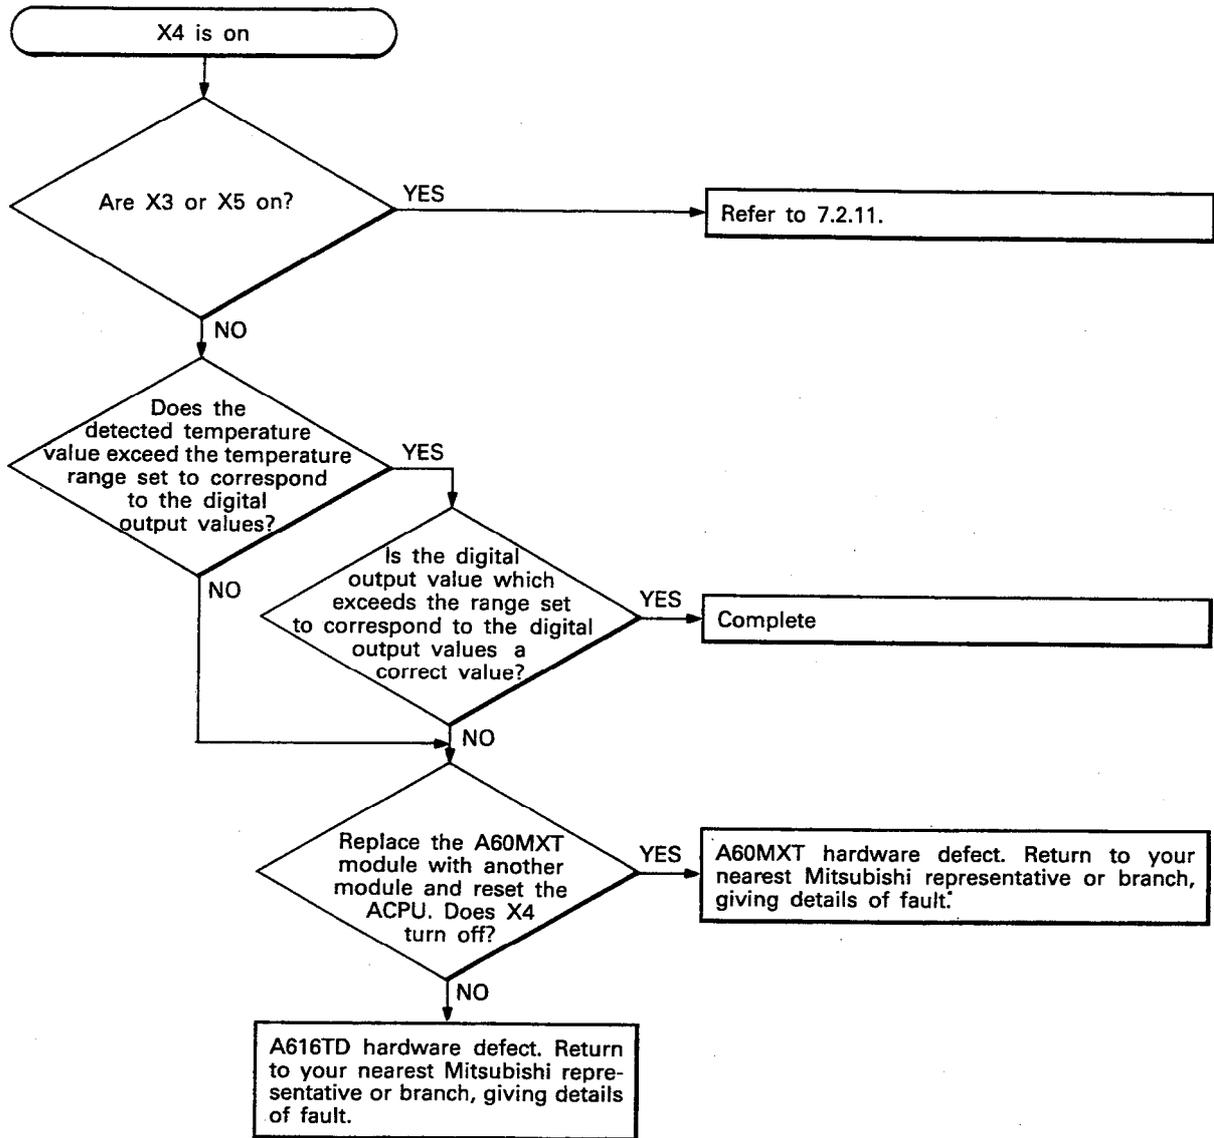

7.2.11 Discontinuity error detected (X3) or detected temperature output value out-of-range (X5) signal on

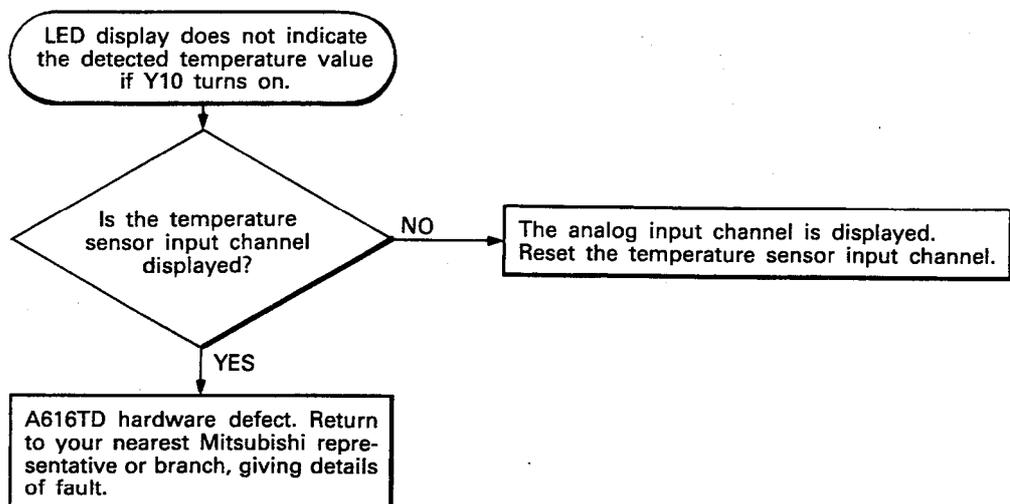

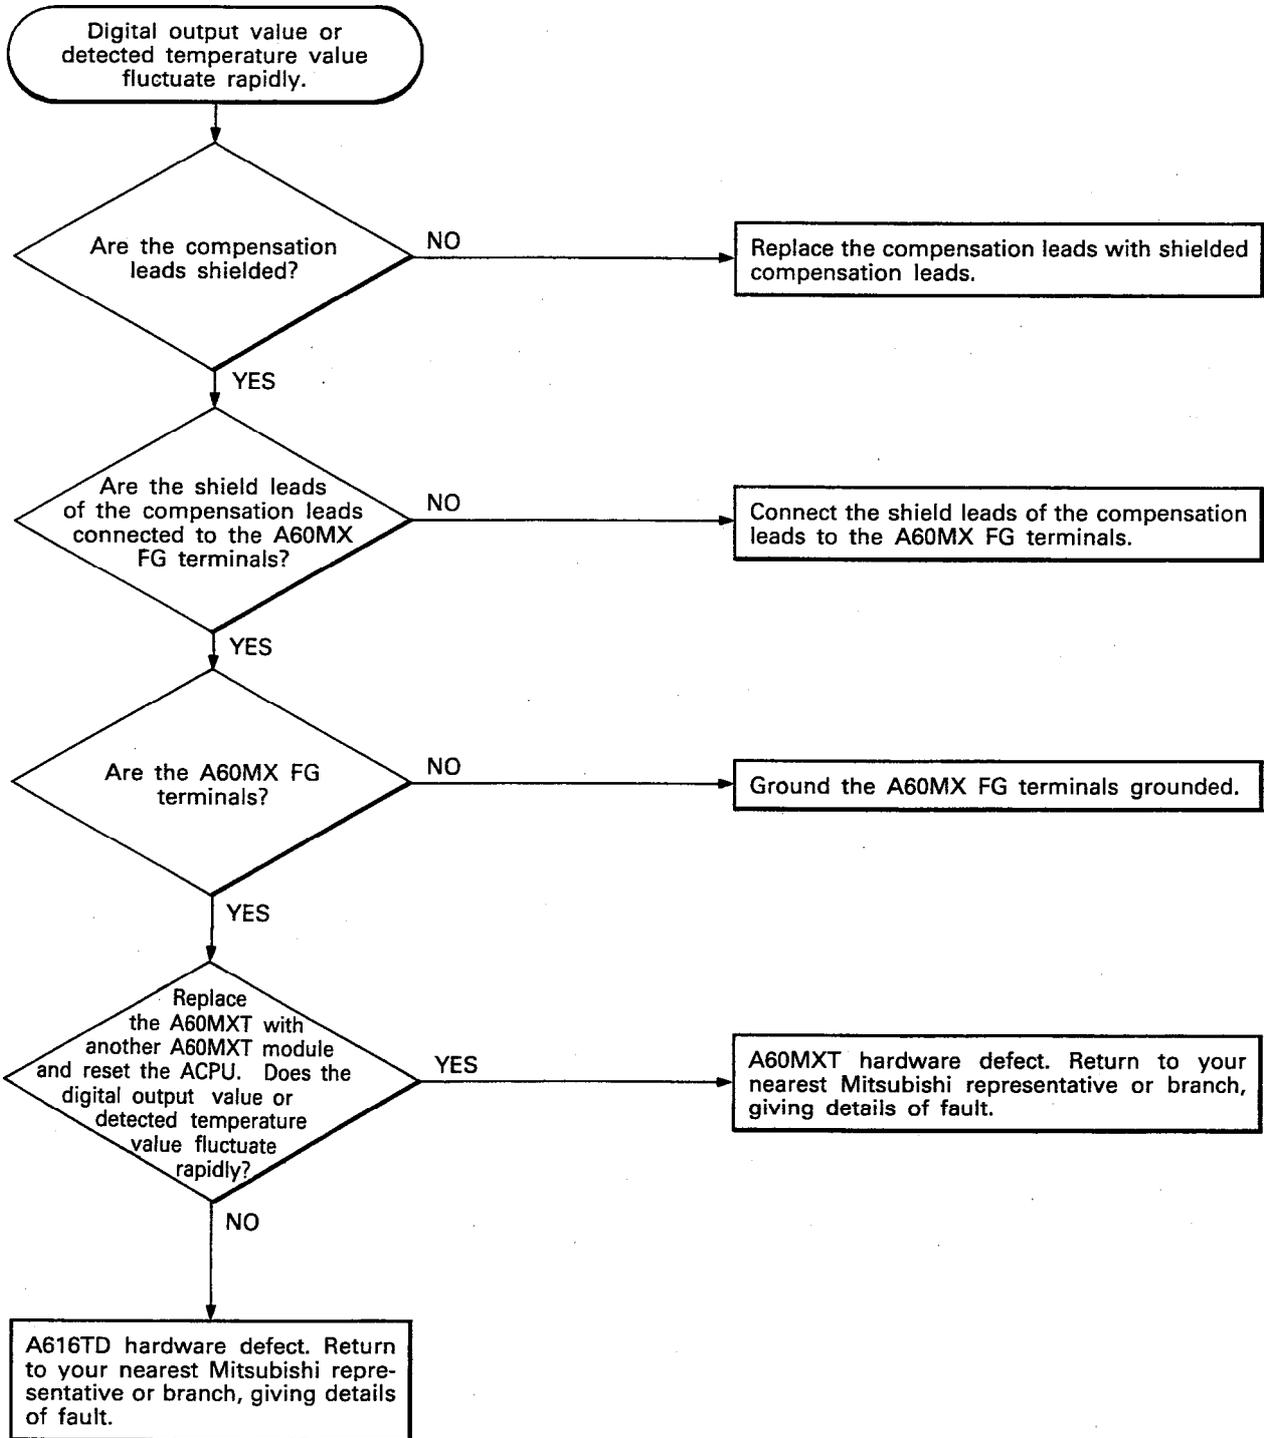

7.2.12 Digital output value out-of-range signal (X4) on

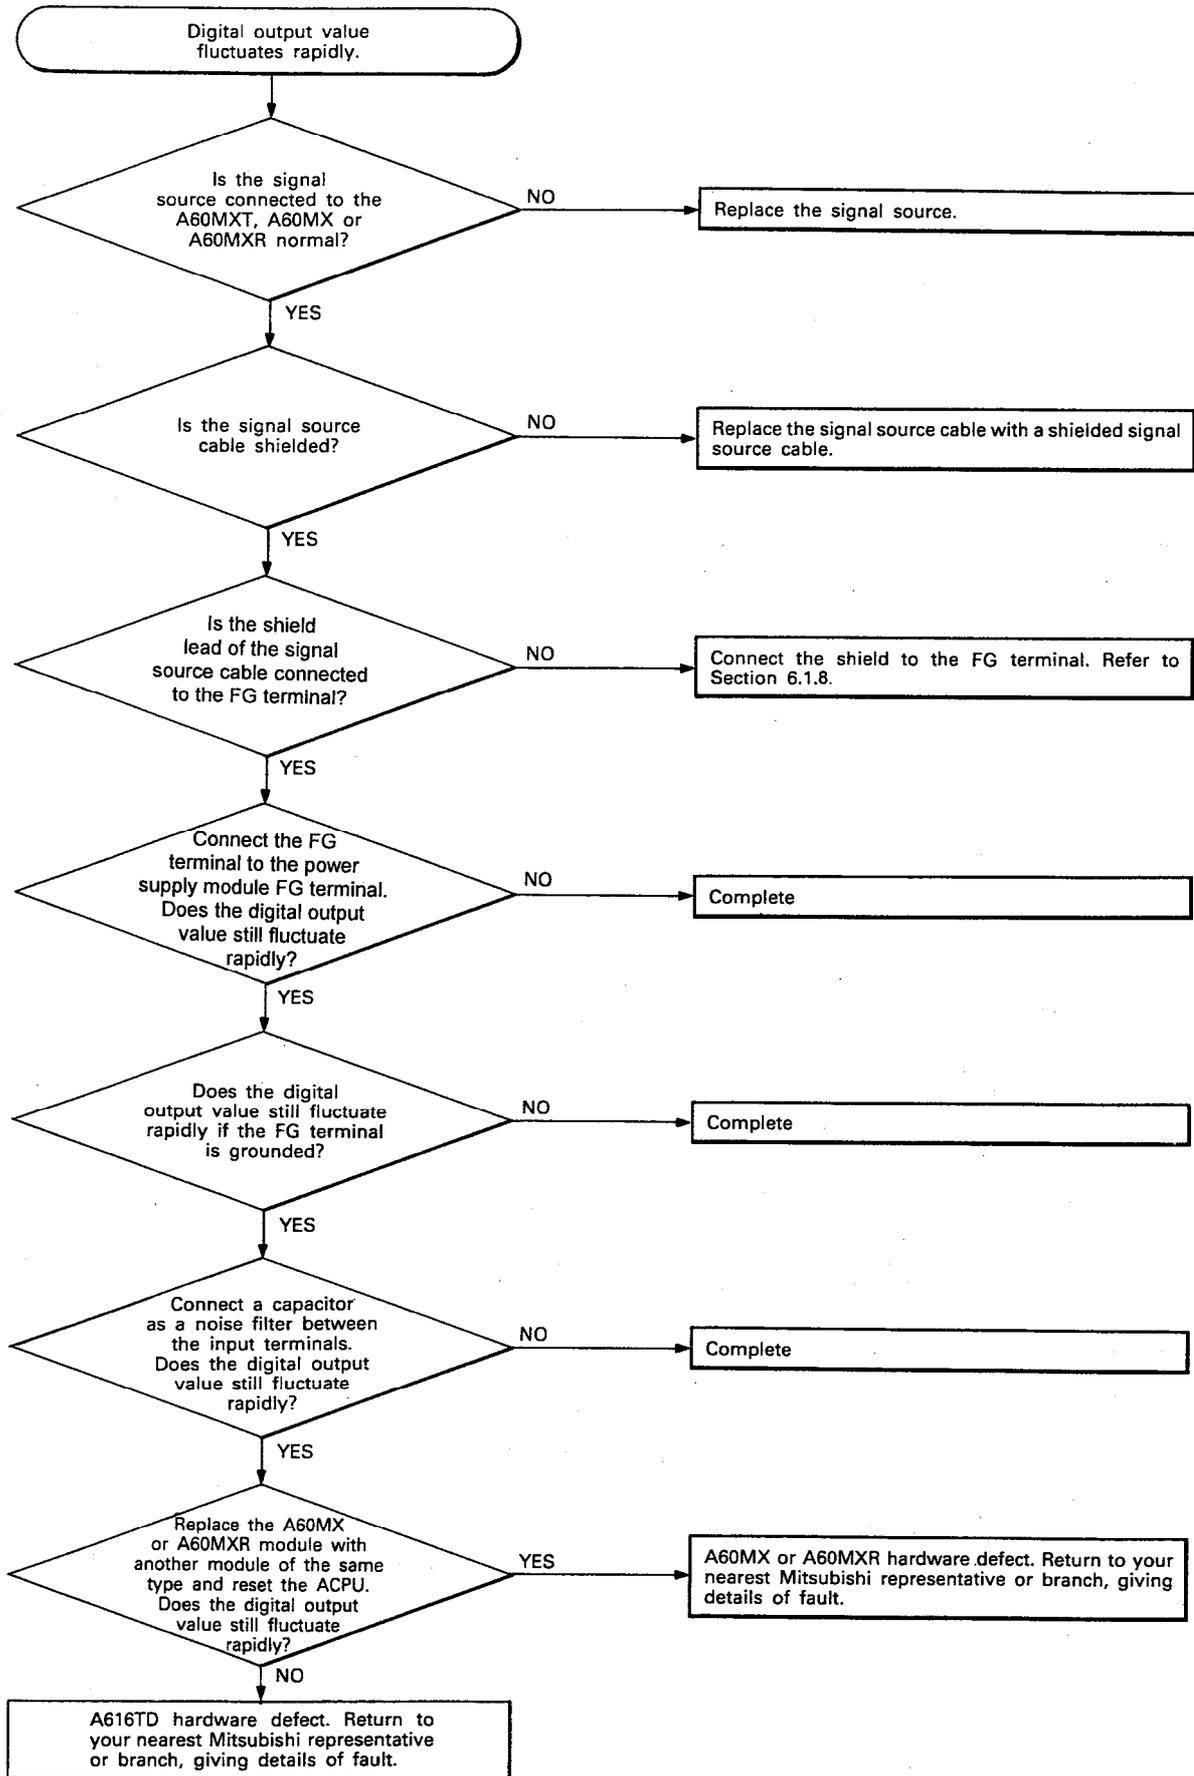

7.2.13 Detected temperature value not indicated if detected temperature value LED display request signal (Y10) turns on

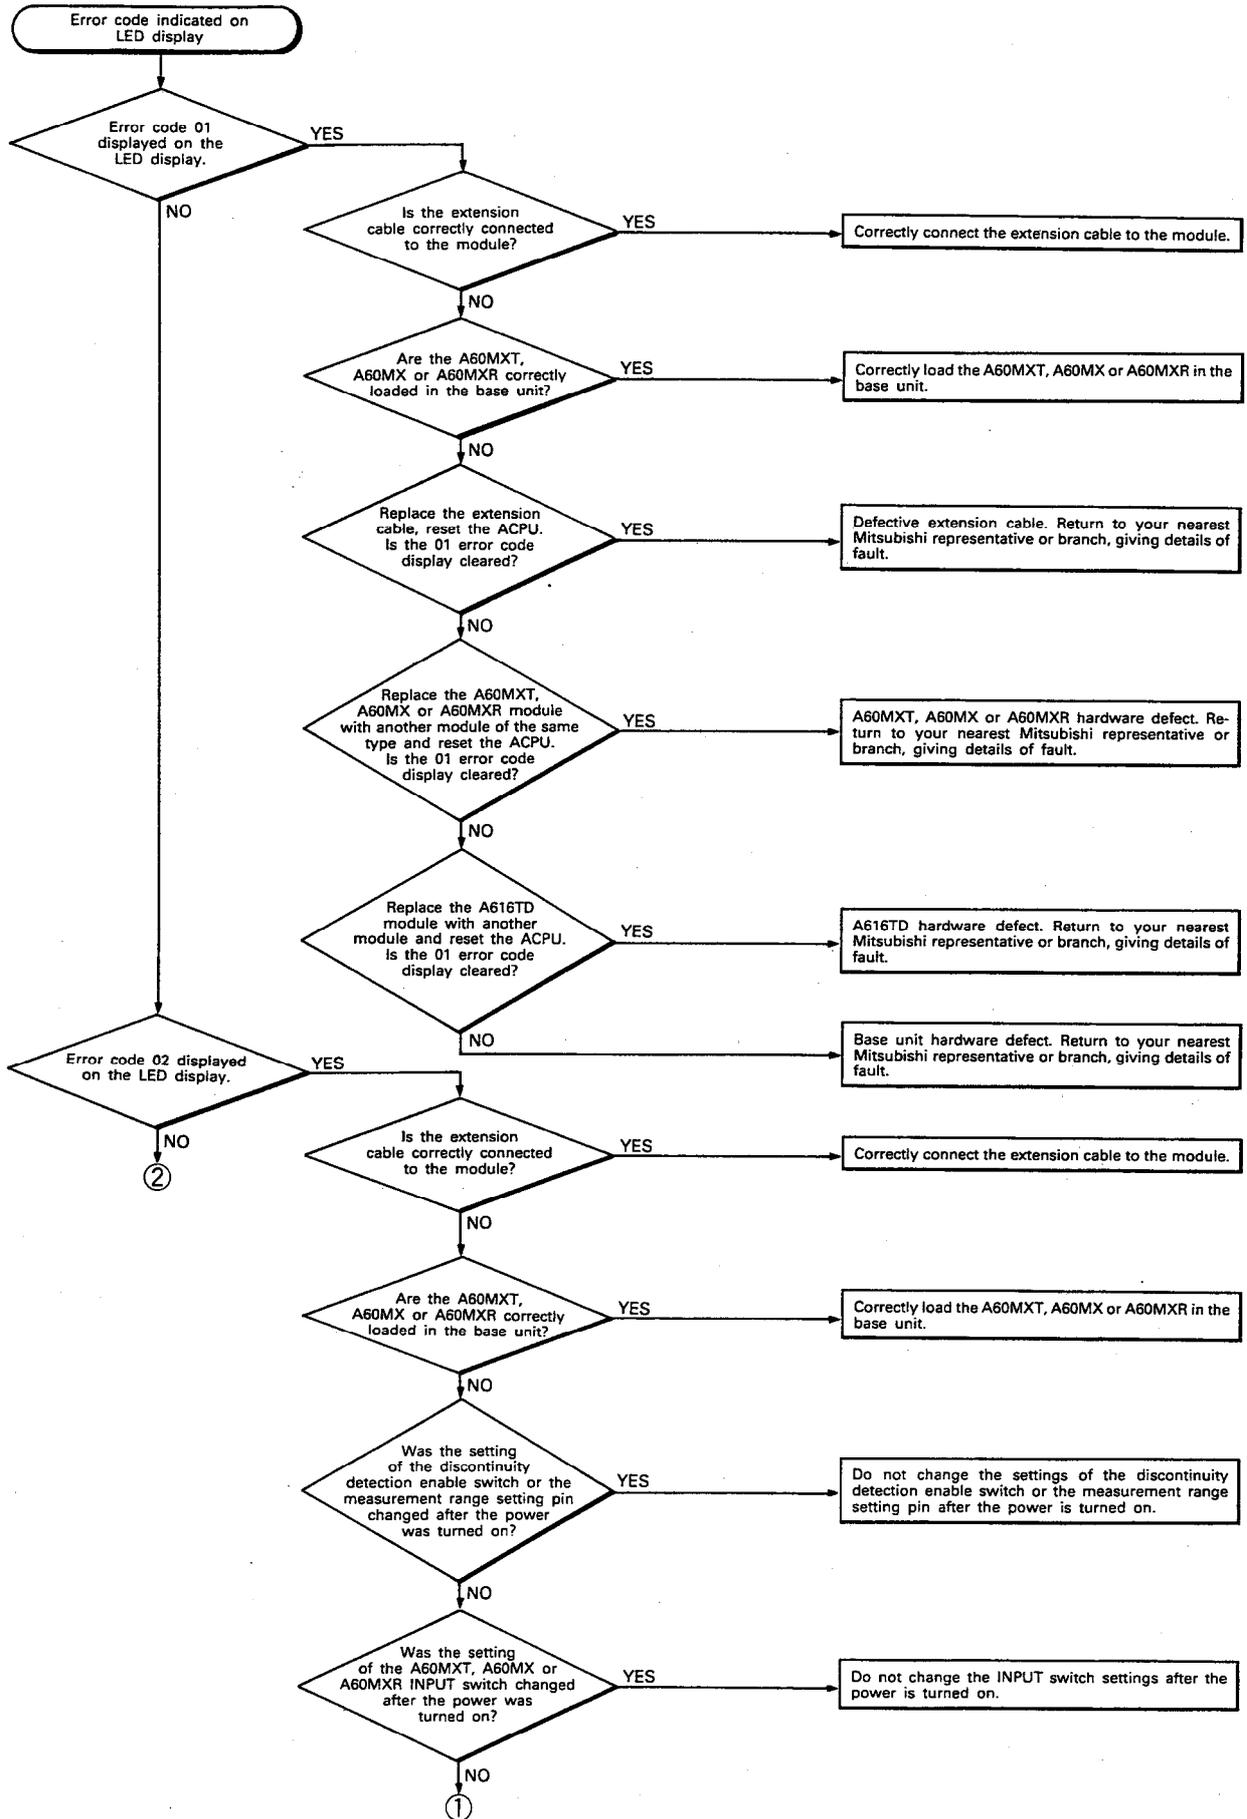

7.2.14 Rapid fluctuations of digital output value or detected temperature value during temperature sensor input

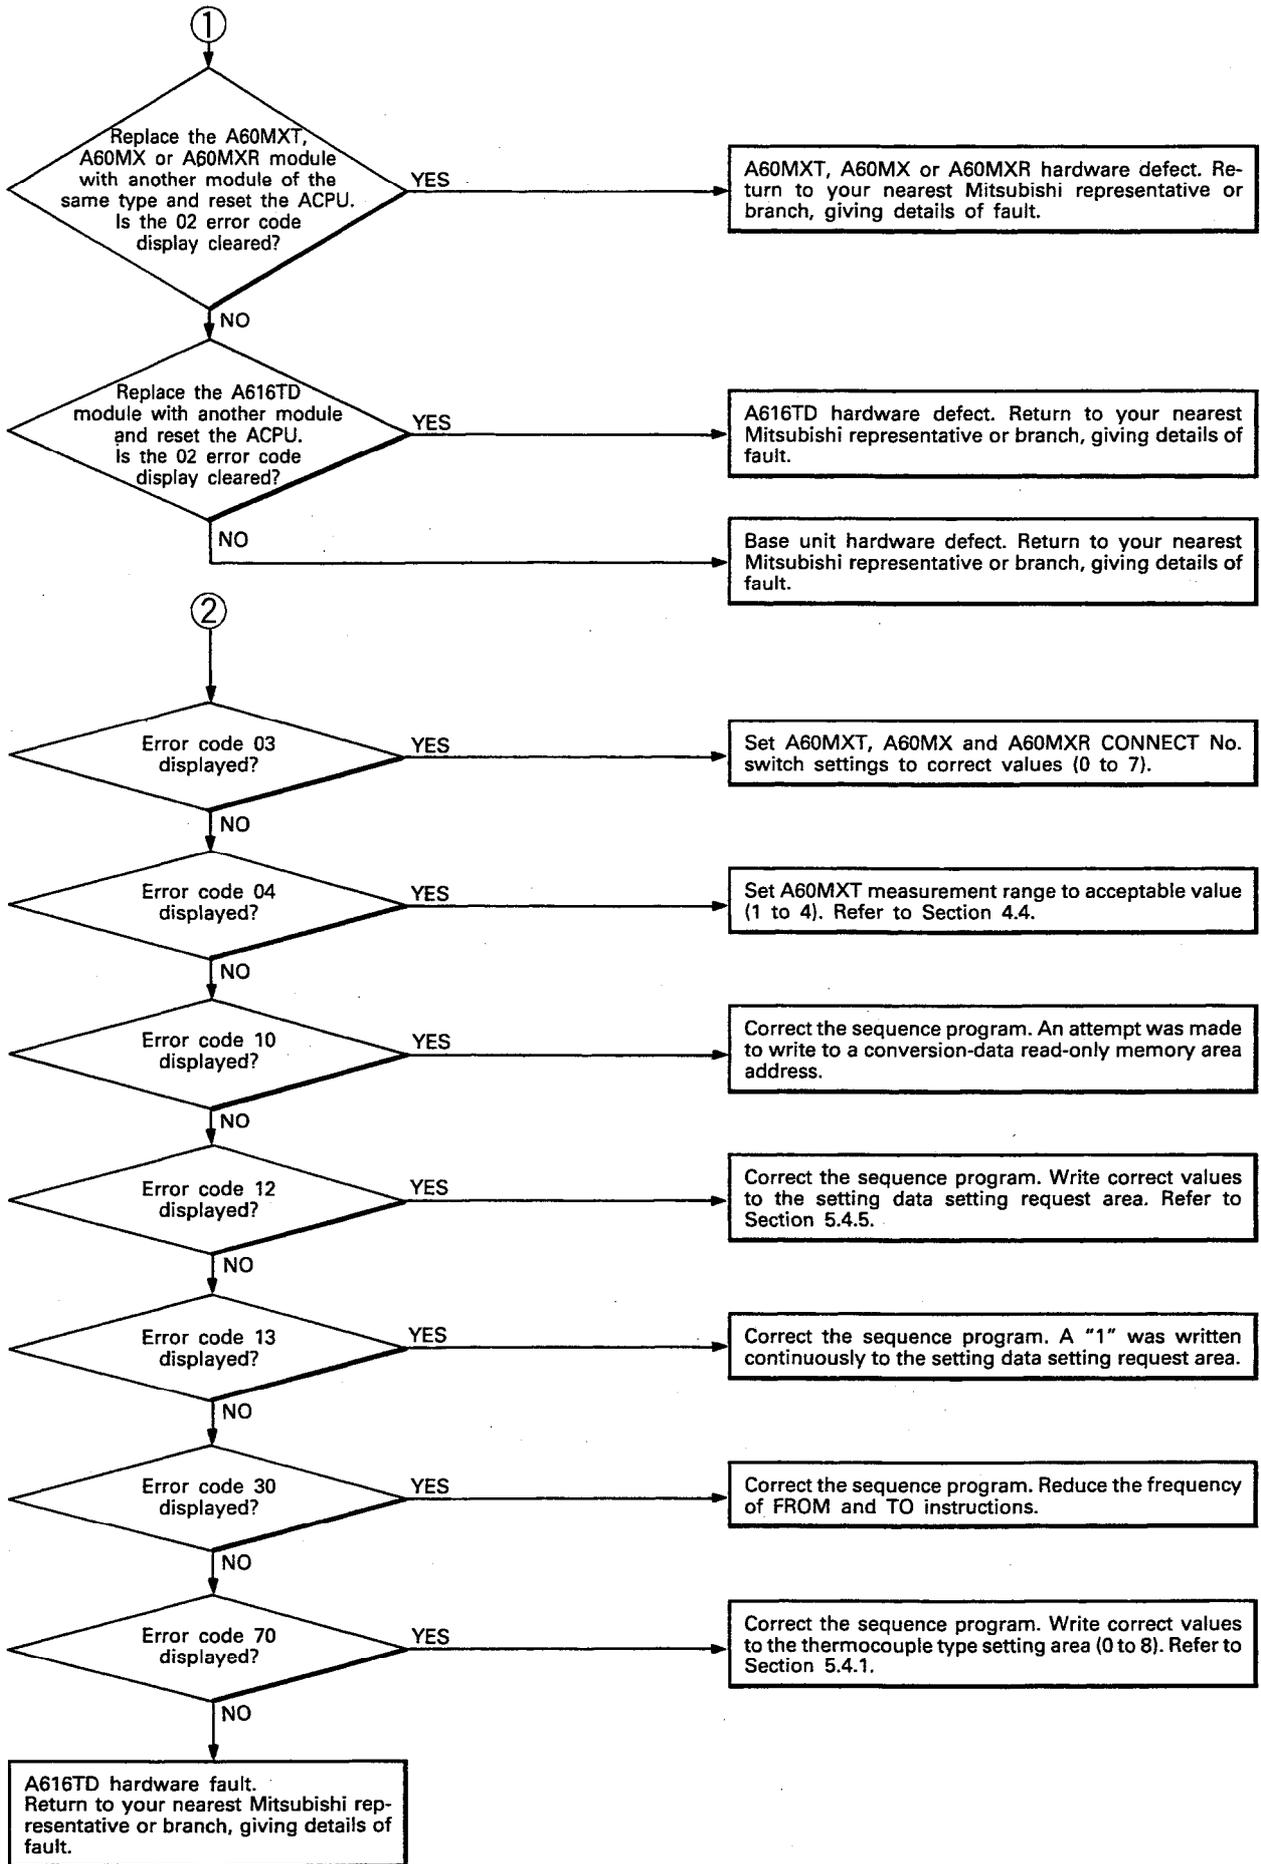

7.2.15 Digital output value fluctuates rapidly during analog input

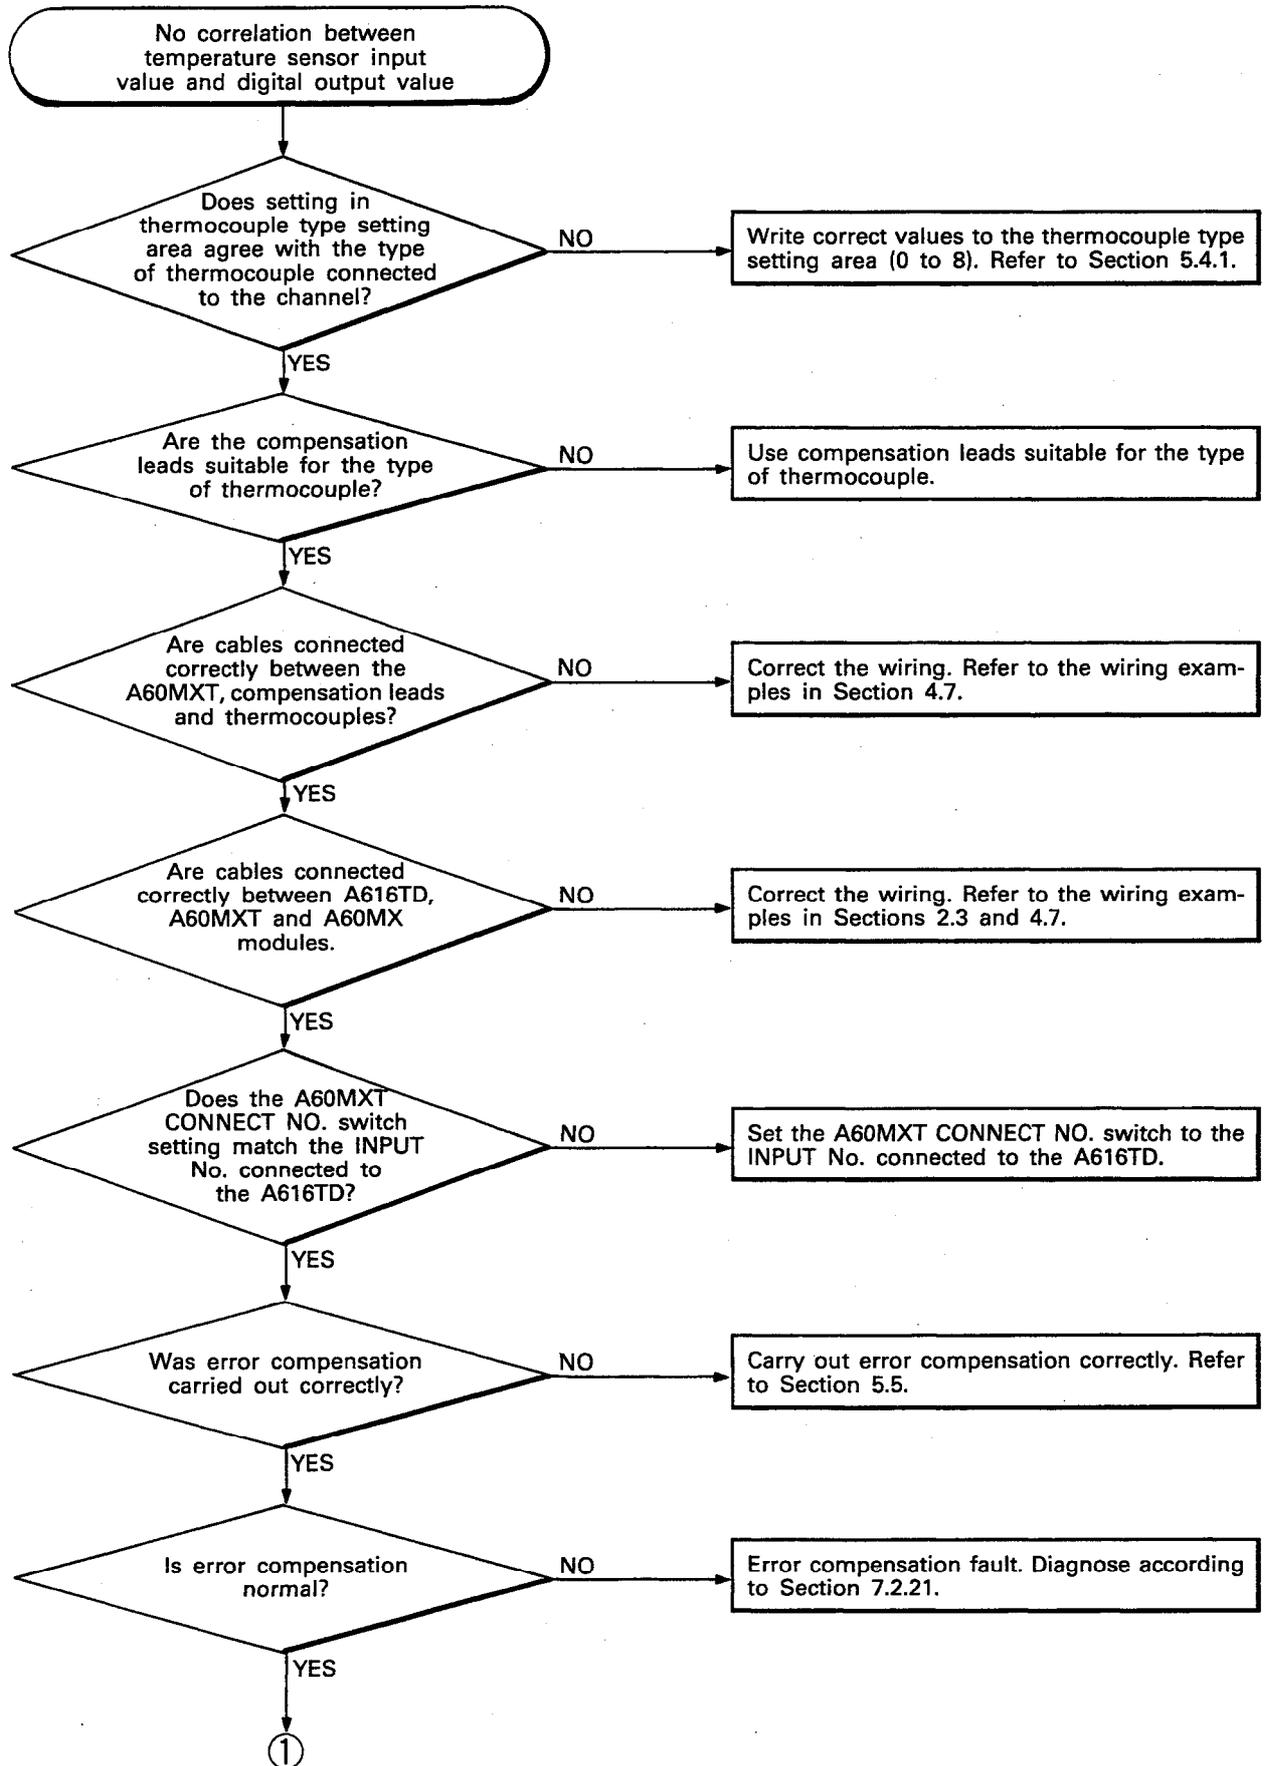

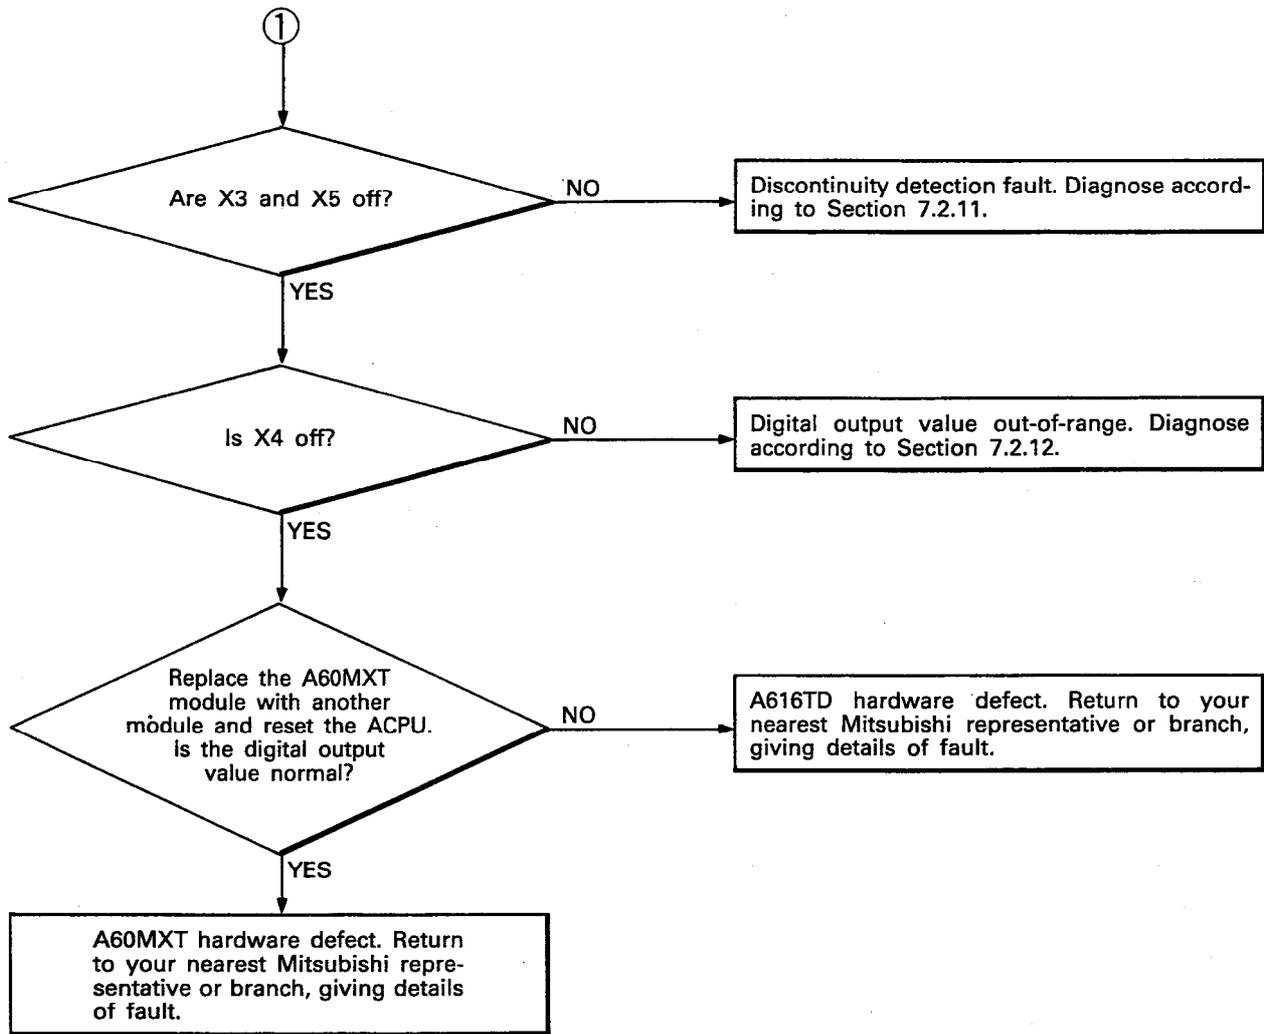

7.2.16 Error code indicated on LED display

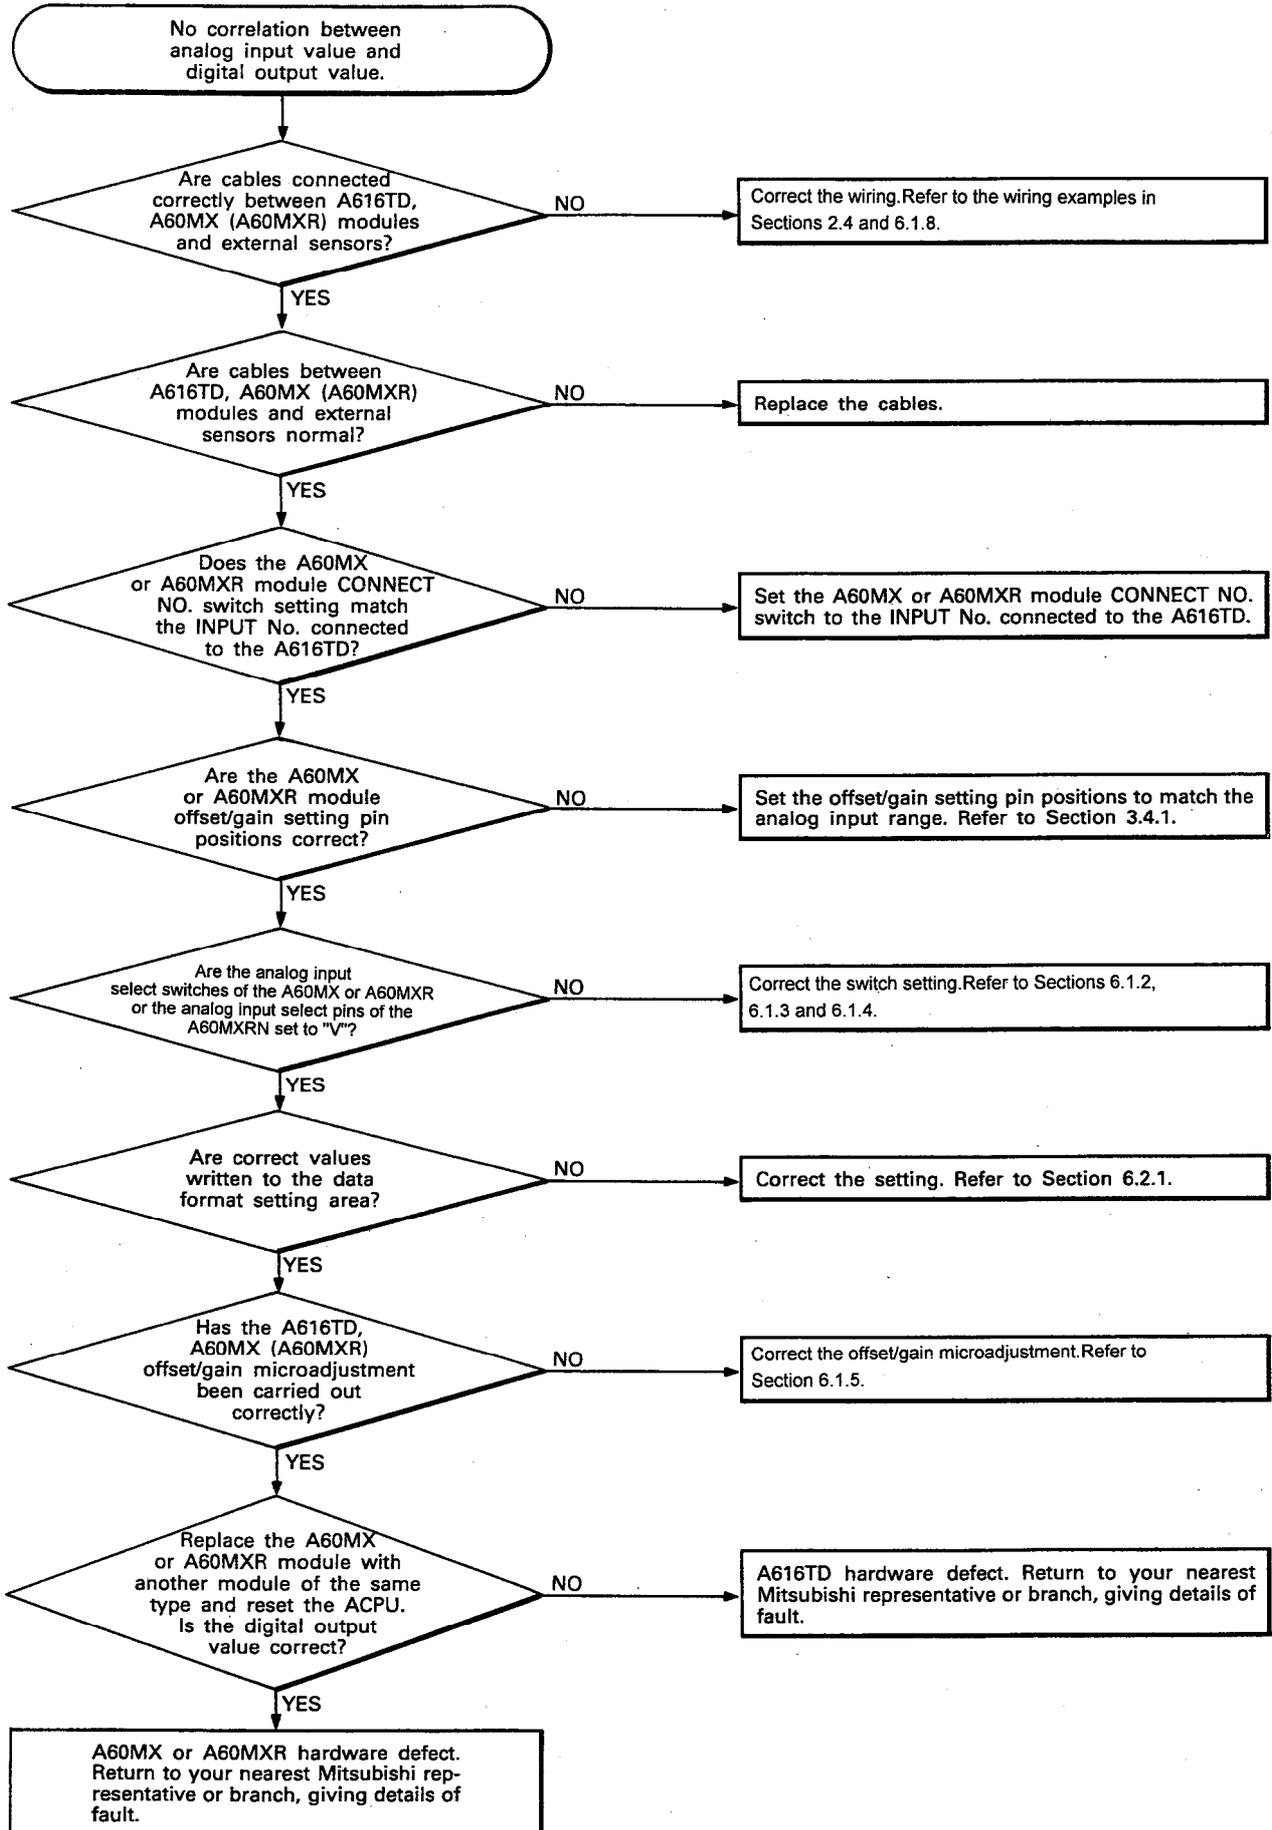

7.2.17 No correlation between temperature sensor input value and digital output value

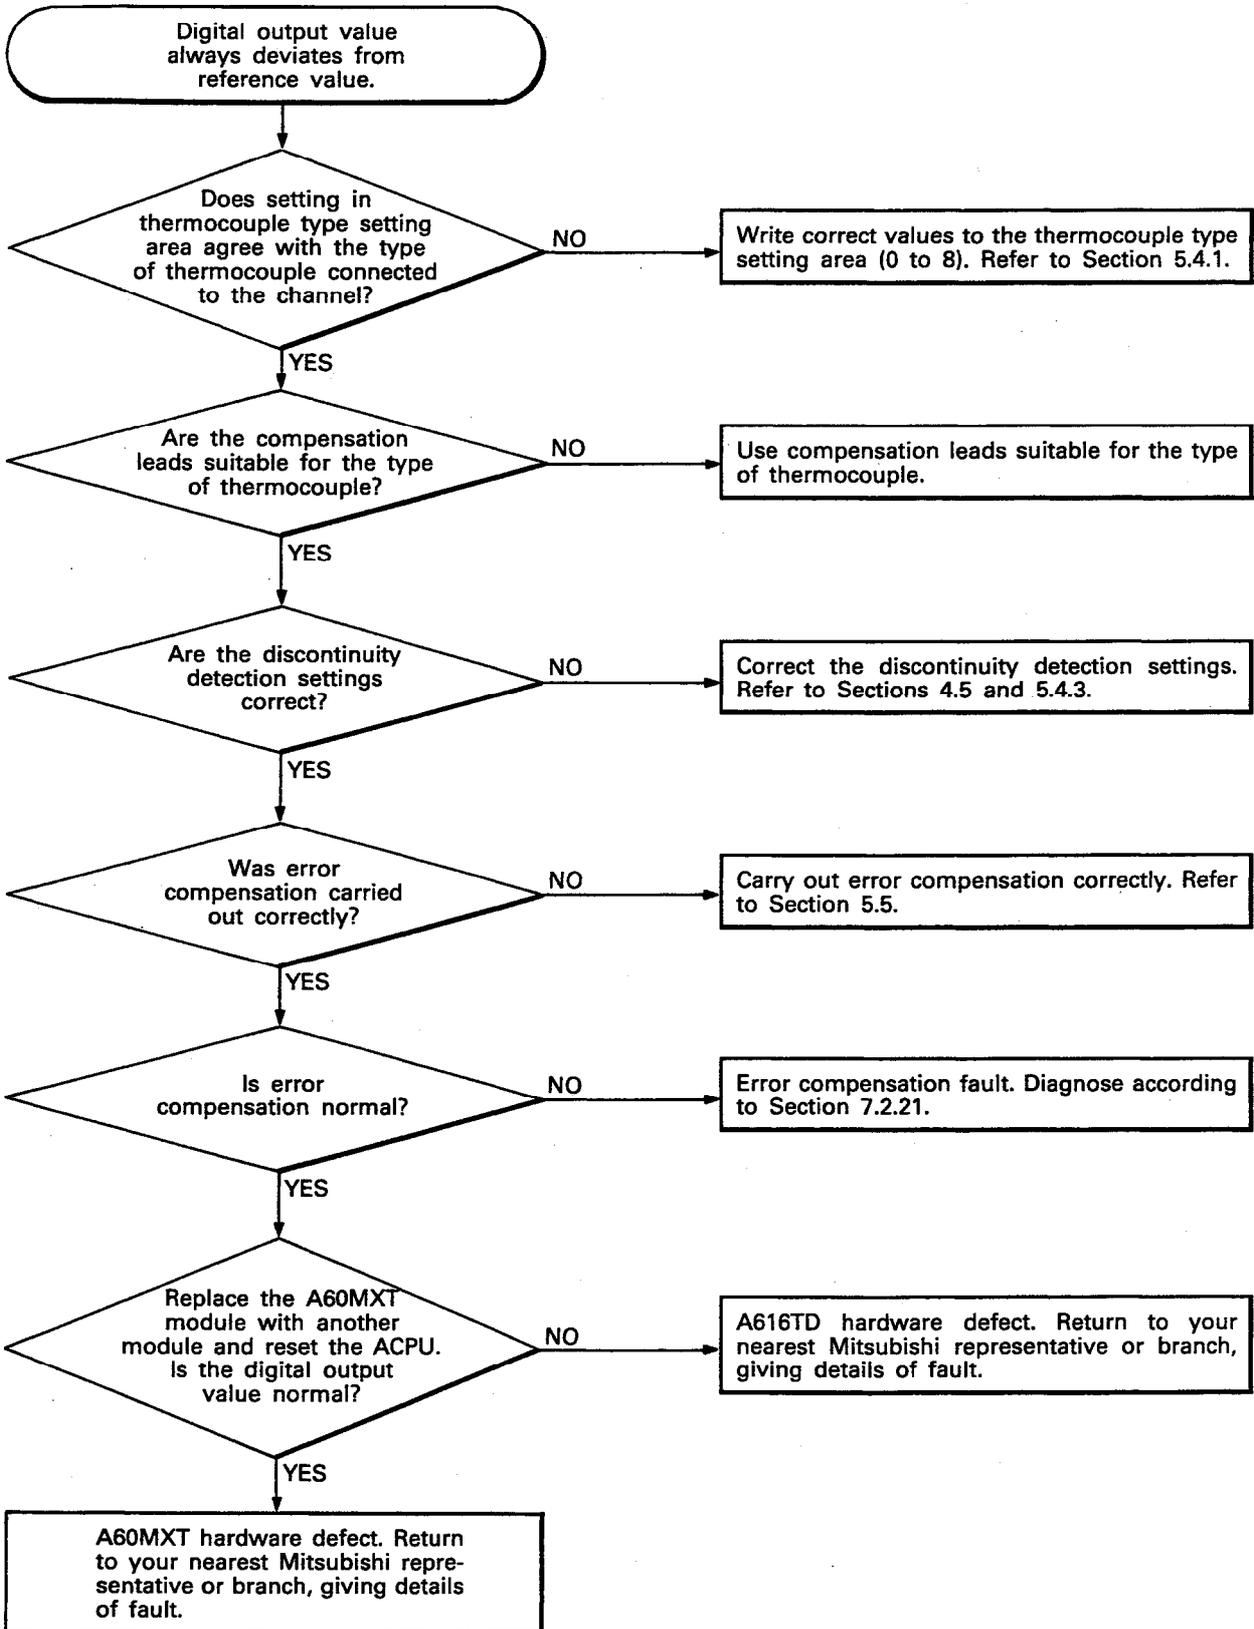

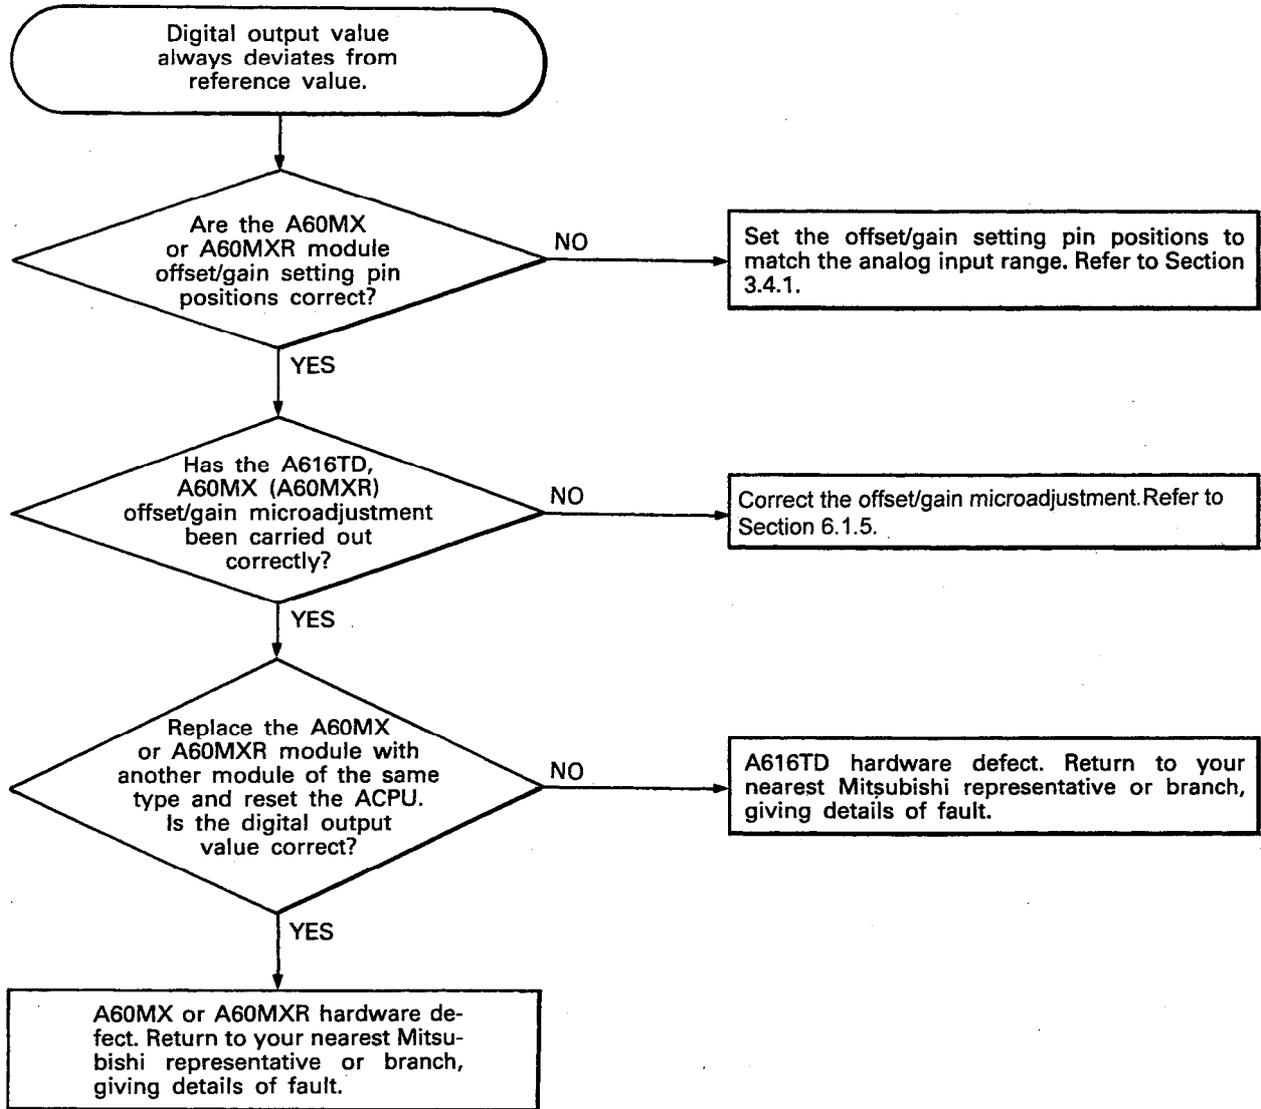

7.2.18 No correlation between analog input value and digital output value

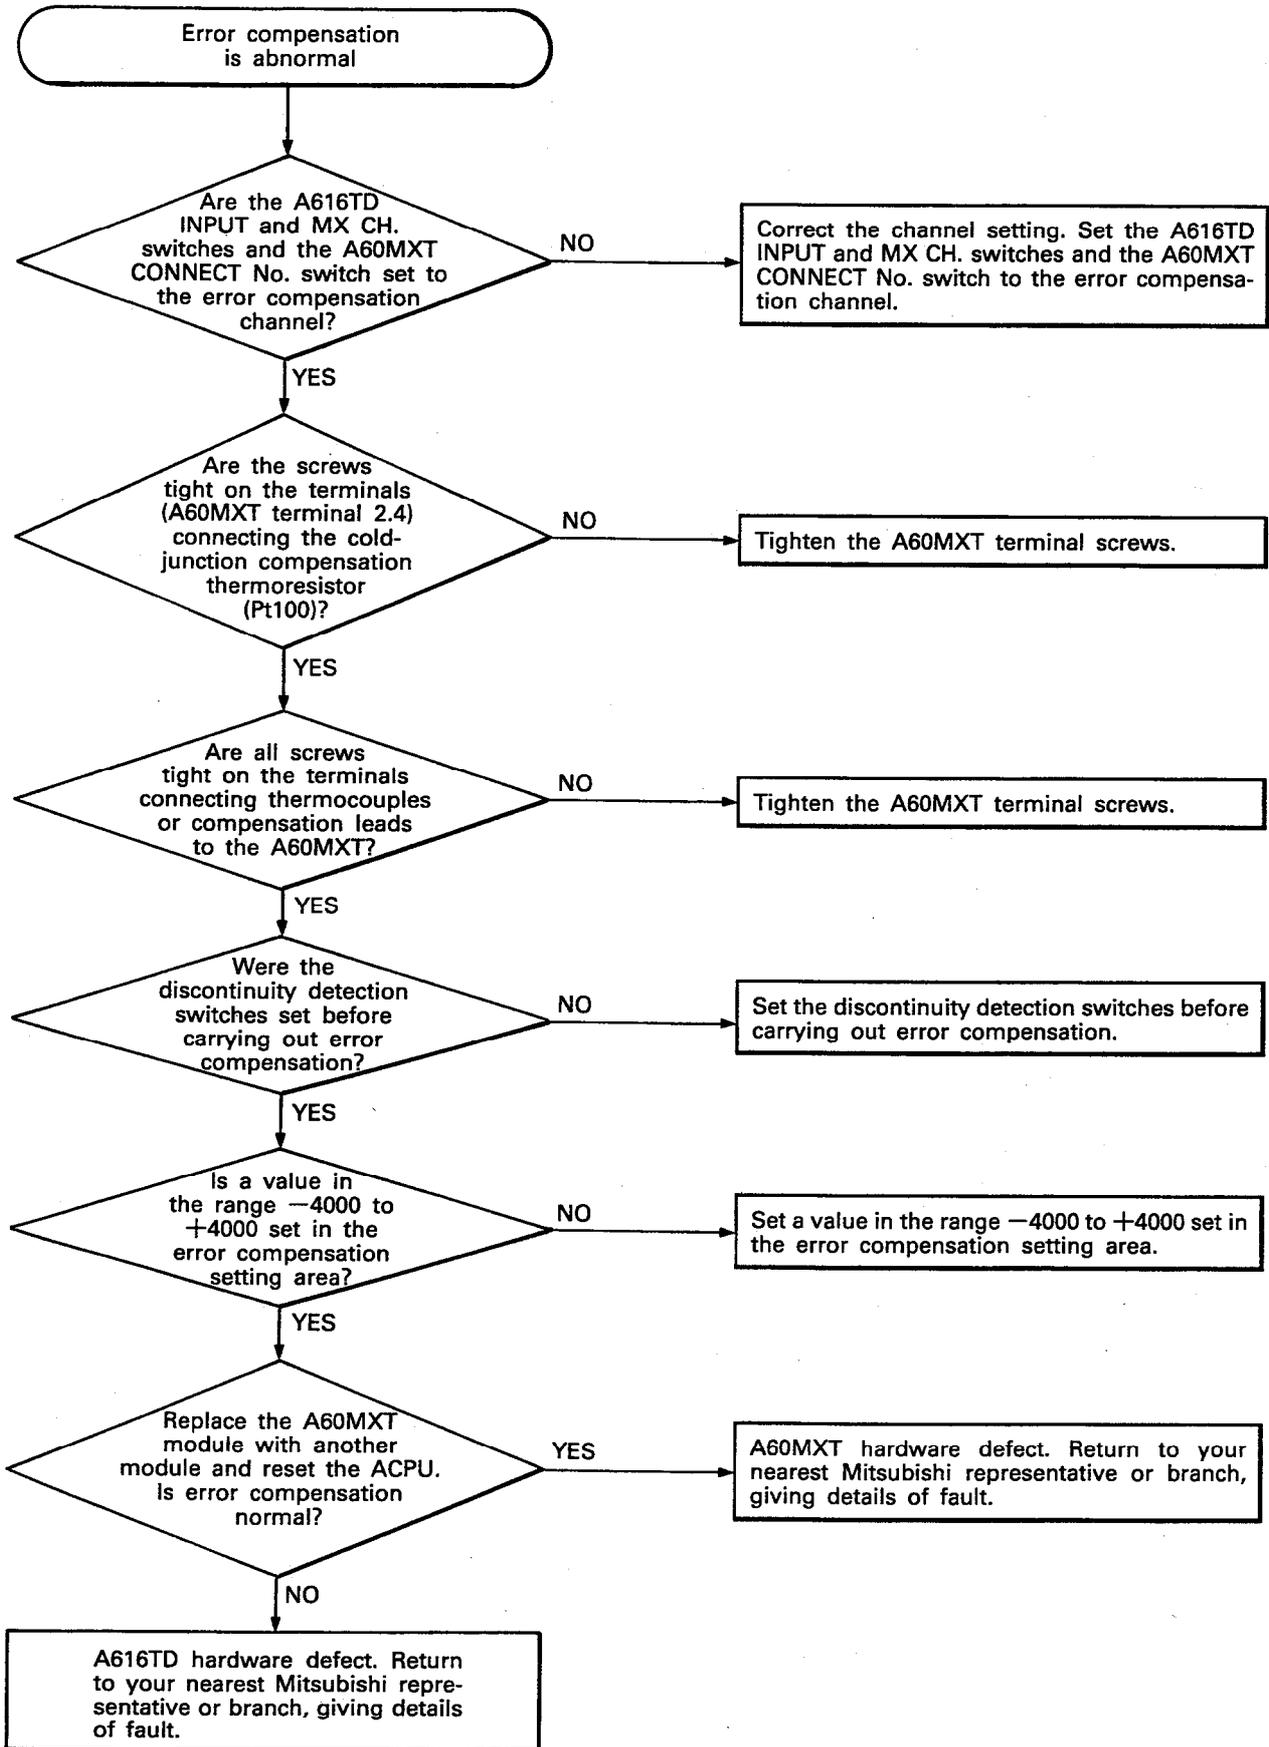

7.2.19 Constant digital output value deviation from reference value during temperature sensor input

7.2.20 Constant digital output value deviation from reference value during analog input

7.2.21 Error compensation is abnormal

## APPENDICES

## Appendix 1 Thermocouple Normal and Overheat Temperature Limits

JIS C1602 - 1981

Material Code	Previous Code (reference)	Wire Diameter (mm)	Normal Temperature Limits (°C)	Overheat Temperature Limit (°C)
B	—	0.50	1500	1700
R	—	0.50	1400	1600
S				
K	CA	0.65	650	850
		1.00	750	950
		1.60	850	1050
		2.30	900	1100
		3.20	1000	1200
E	CRC	0.65	450	500
		1.00	500	550
		1.60	550	650
		2.30	600	750
		3.20	700	800
J	IC	0.65	400	500
		1.00	450	550
		1.60	500	650
		2.30	550	750
		3.20	600	750
T	CC	0.32	200	250
		0.65	200	250
		1.00	250	300
		1.60	300	350

Note: "Normal temperature limit" refers to the limit temperature for continuous operation of the thermocouple in air.

"Overheat temperature limit" refers to the limit temperature exceeding the normal temperature limit for short periods.

## Appendix 2 Temperature Tolerances

JIS C1602 - 1981

Material Code	Previous Code (reference)	Measured Temperature Range (°C)	Class	Tolerance
B	—	600 to 1700	0.5	$\pm 4^{\circ}\text{C}$ or measured temperature $\pm 0.5\%$
R	—	0 to 1600	0.25	$\pm 1.5^{\circ}\text{C}$ or measured temperature $\pm 0.25\%$
S				
K	CA	0 to 1000	0.4	$\pm 1.5^{\circ}\text{C}$ or measured temperature $\pm 0.4\%$
		0 to 1200	0.75	$\pm 2.5^{\circ}\text{C}$ or measured temperature $\pm 0.75\%$
		-200 to 0	1.5	$\pm 2.5^{\circ}\text{C}$ or measured temperature $\pm 1.5\%$
E	CRC	0 to 800	0.4	$\pm 1.5^{\circ}\text{C}$ or measured temperature $\pm 0.4\%$
		0 to 800	0.75	$\pm 2.5^{\circ}\text{C}$ or measured temperature $\pm 0.75\%$
		-200 to 0	1.5	$\pm 2.5^{\circ}\text{C}$ or measured temperature $\pm 1.5\%$
J	IC	0 to 750	0.4	$\pm 1.5^{\circ}\text{C}$ or measured temperature $\pm 0.4\%$
		0 to 750	0.75	$\pm 2.5^{\circ}\text{C}$ or measured temperature $\pm 0.75\%$
T	CC	0 to 350	0.4	$\pm 0.5^{\circ}\text{C}$ or measured temperature $\pm 0.4\%$
		0 to 350	0.75	$\pm 1^{\circ}\text{C}$ or measured temperature $\pm 0.75\%$
		-200 to 0	1.5	$\pm 1^{\circ}\text{C}$ or measured temperature $\pm 1.5\%$

Note: "Tolerance" refers to the maximum permitted limit of the difference in temperature between the temperature looked up in a standard thermoelectromotive force table corresponding to the thermoelectromotive force, and the measuring junction temperature.

The tolerance is taken as the larger of the temperature (°C) and percentage (%) values.

Appendix 3 Thermoelectromotive Force Tables

Type B

3.1 Standard thermoelectromotive force tables for type B thermocouples

JIS C1602-1981 (Complying with ANSI MC 96. 1-1975, BS1041-1966 and DIN43710-1977.)

REMARKS

These tables apply for a reference junction temperature of 0°C.  
 Subtract  $-3 \mu V$  from the values in the tables for a reference junction temperature of 20°C.

Type R

**3.2 Standard thermoelectromotive force tables for type R thermocouples**

JIS C1602-1981 (Complying with ANSI MC 96. 1-1975, BS1041-1966 and DIN43710-1977.)

**REMARKS**

These tables apply for a reference junction temperature of 0°C.  
 Subtract 111  $\mu$ V from the values in the tables for a reference junction temperature of 20°C.

Type S

3.3 Standard thermoelectromotive force tables for type S thermocouples

JIS C1602-1981 (Complying with ANSI MC 96. 1-1975, BS1041-1966 and DIN43710-1977.)

**REMARKS**

These tables apply for a reference junction temperature of 0°C.  
 Subtract  $-3 \mu V$  from the values in the tables for a reference junction temperature of 20°C.

Type K

3.4 Standard thermoelectromotive force tables for type K thermocouples

JIS C1602-1981 (Complying with ANSI MC 96. 1-1975, BS1041-1966 and DIN43710-1977.)

**REMARKS**

These tables apply for a reference junction temperature of 0°C.  
 Subtract 798  $\mu V$  from the values in the tables for a reference junction temperature of 20°C.

Type E

3.5 Standard thermoelectromotive force tables for type E thermocouples

JIS C1602-1981 (Complying with ANSI MC 96. 1-1975, BS1041-1966 and DIN43710-1977.)

**REMARKS**

These tables apply for a reference junction temperature of 0°C.  
 Subtract  $-3 \mu$ V from the values in the tables for a reference junction temperature of 20°C.

Type J

3.6 Standard thermoelectromotive force tables for type J thermocouples

JIS C1602-1981 (Complying with ANSI MC 96. 1-1975, BS1041-1966 and DIN43710-1977.)

**REMARKS**

These tables apply for a reference junction temperature of 0°C.  
 Subtract 1019  $\mu V$  from the values in the tables for a reference junction temperature of 20°C.

Type T

3.7 Standard thermoelectromotive force tables for type T thermocouples

**REMARKS**

These tables apply for a reference junction temperature of 0°C.  
 Subtract 789  $\mu V$  from the values in the tables for a reference junction temperature of 20°C.

Type Fe-CuNi

3.8 Standard thermoelectromotive force tables for type Fe-CuNi thermocouples

DIN43710-1977

**Appendix 4 Precautions for Replacing A60MXT with A60MXTN**

The following are the precautions for replacing the A60MXT with the A60MXTN.

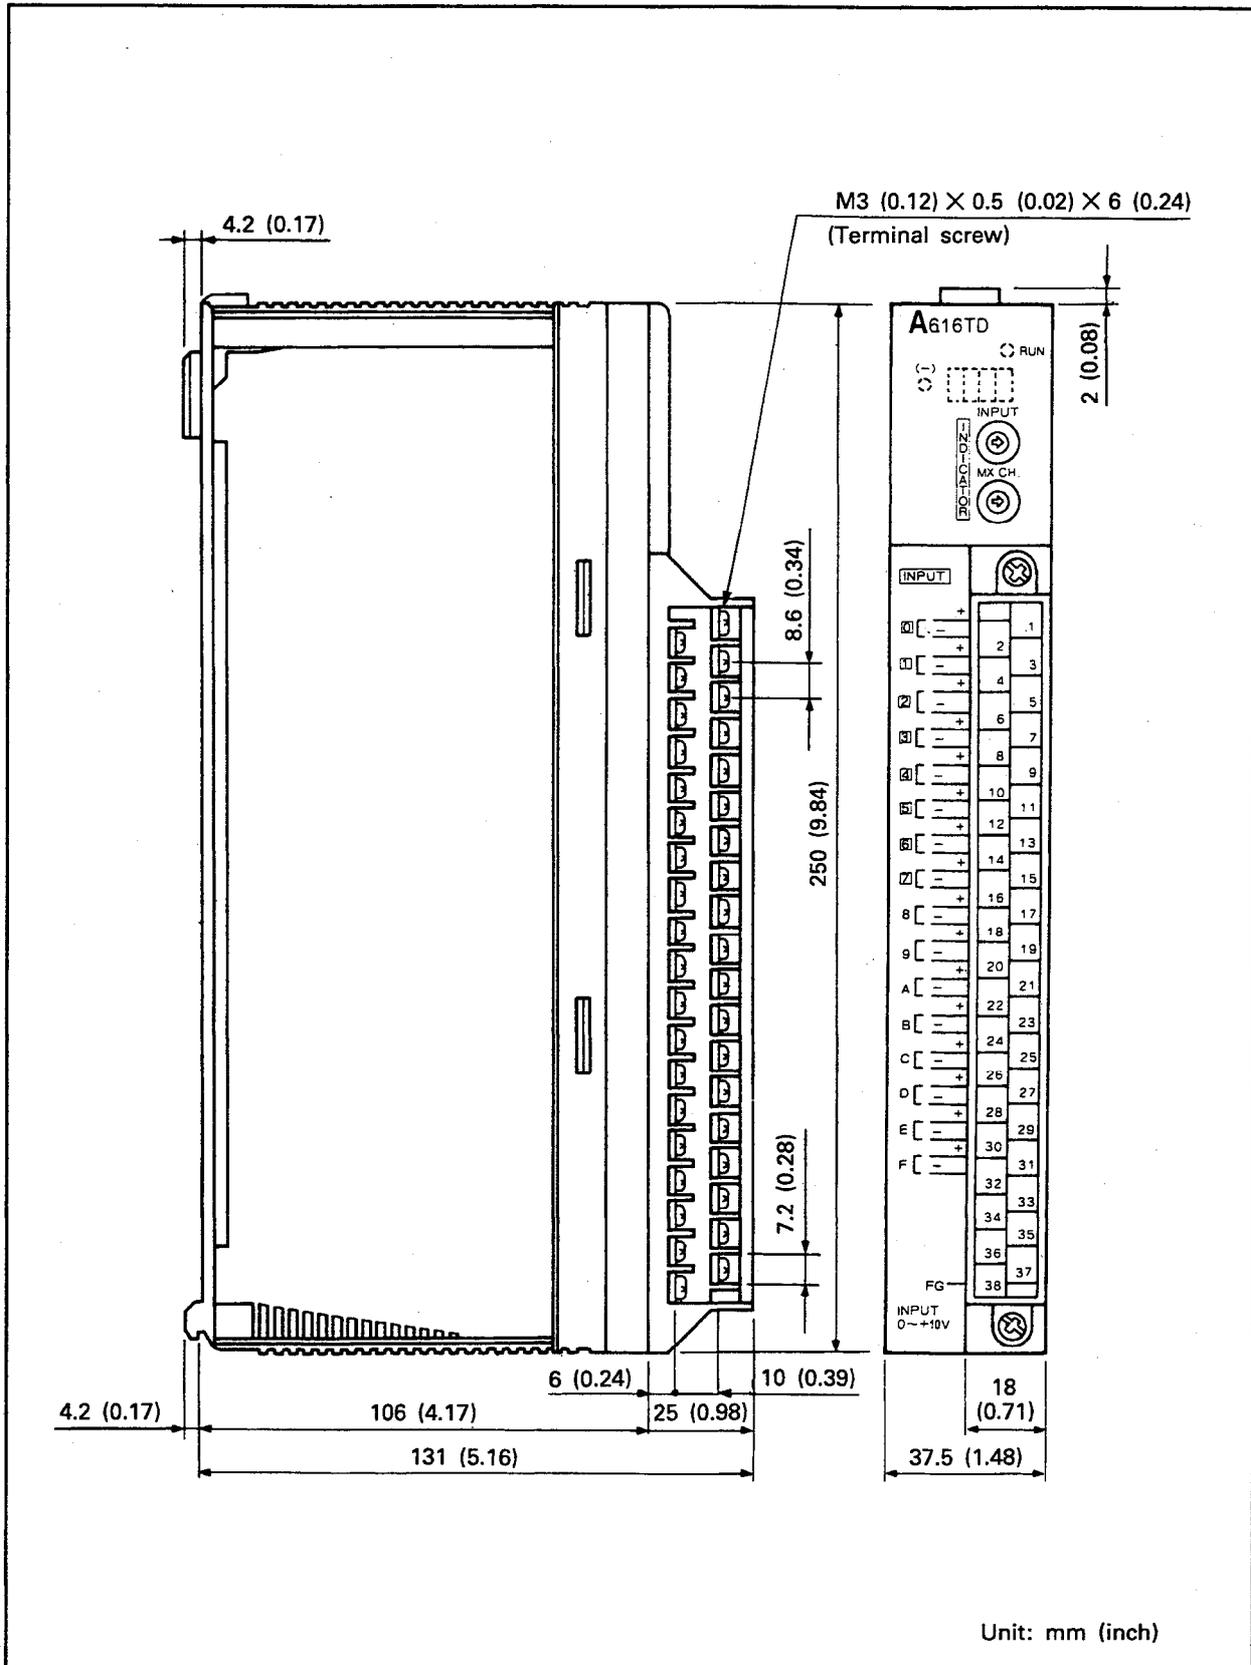

- (1) The inter-channel dielectric withstand voltage of the A60MXT is 500VDC (accuracy guarantee 500VDC) while that of the A60MXTN is 400VDC (accuracy guarantee 100VDC).
- (2) Since the A60MXTN has the FG2 terminal additionally, part of the wiring must be changed. Refer to Section 4.7 (2) for details.
- (3) Programs created for the A60MXT can be used unchanged for the A60MXTN.

**Appendix 5 Precautions for Replacing A60MXR with A60MXRN**

The following are the precautions for replacing the A60MXR with the A60MXRN.

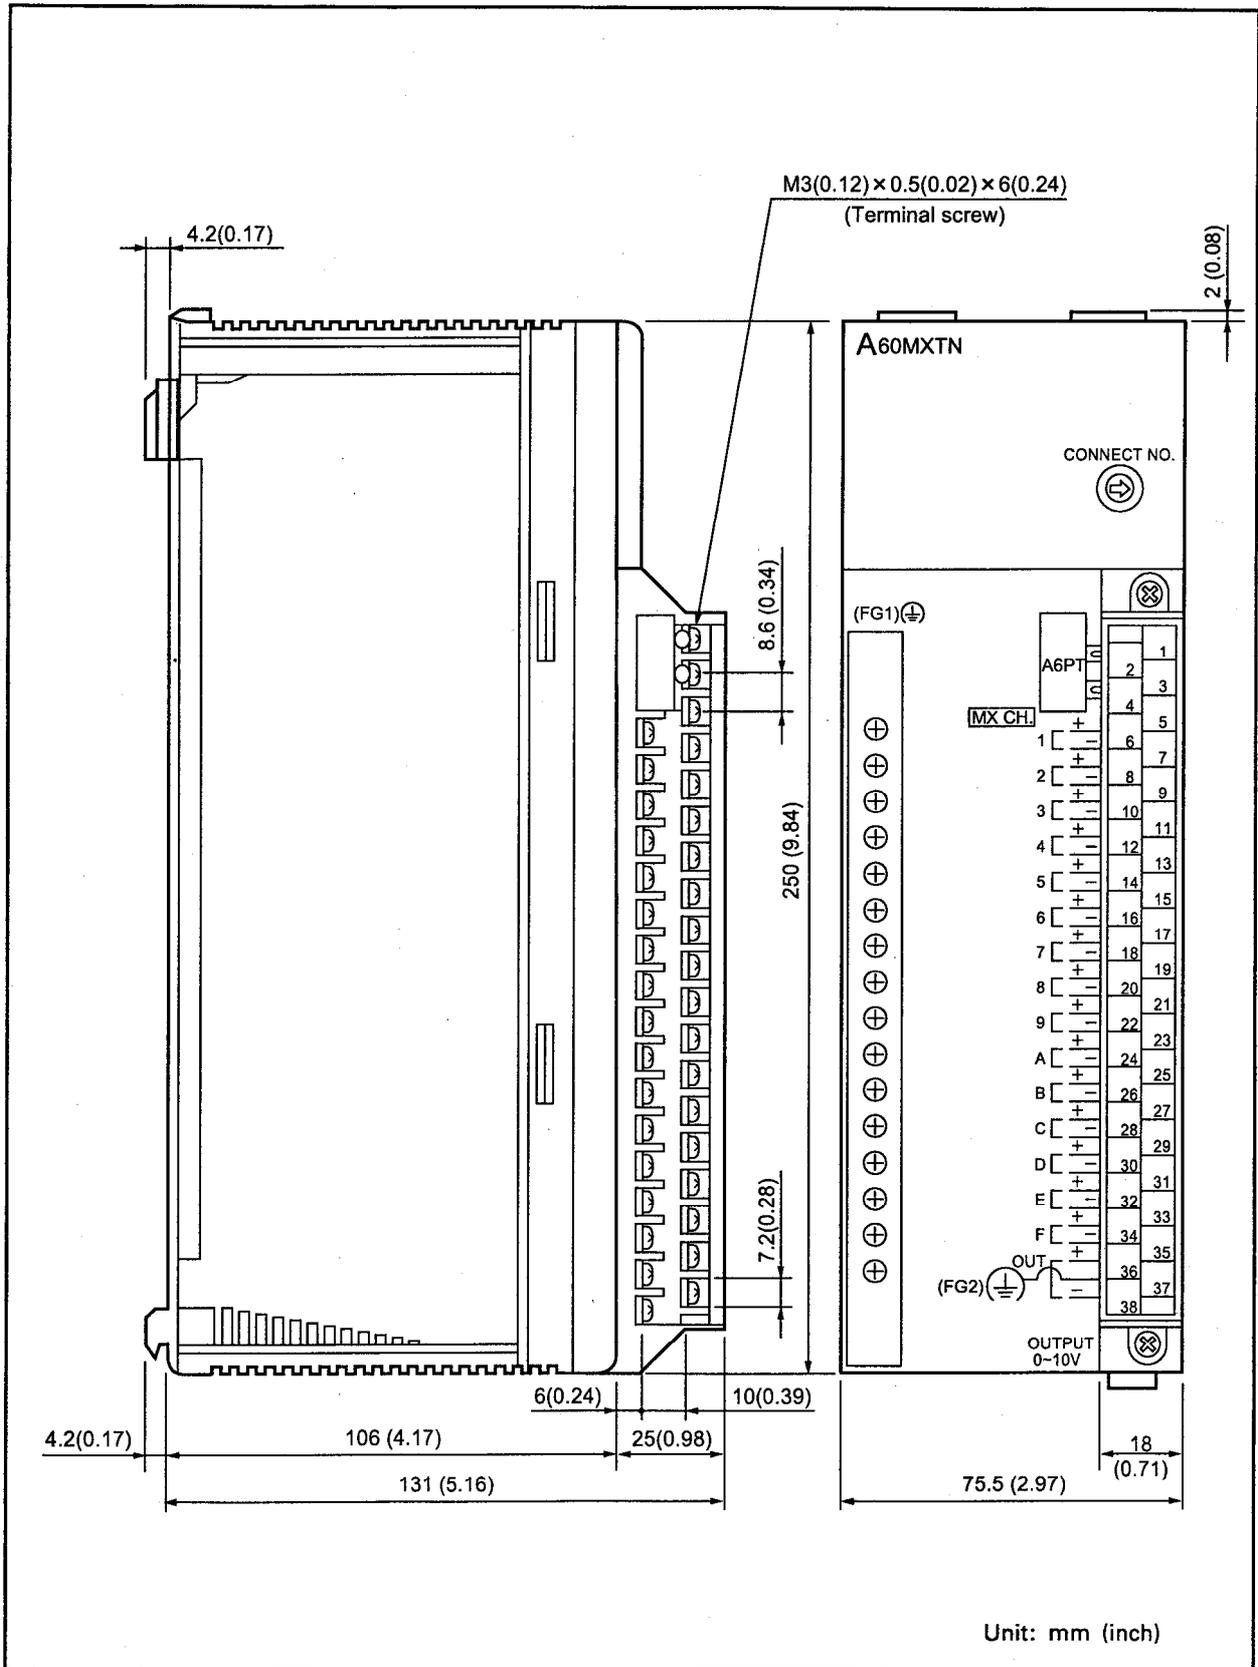

- (1) The inter-channel dielectric withstand voltage of the A60MXR is 500VDC (accuracy guarantee 500VDC) while that of the A60MXRN is 400VDC (accuracy guarantee 400VDC).
- (2) Since the A60MXRN is provided with the setting pins (the A60MXR is provided with the DIP switches) for analog input selection, the setting method differs between the two models.  
Refer to Section 6.1.4 for details.
- (3) Programs created for the A60MXR can be used unchanged for the A60MXRN.

# WARRANTY

Please confirm the following product warranty details before starting use.

## 1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the dealer or Mitsubishi Service Company. Note that if repairs are required at a site overseas, on a detached island or remote place, expenses to dispatch an engineer shall be charged for.

### [Gratis Warranty Term]

The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place.

Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

### [Gratis Warranty Range]

- (1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
- (2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
  1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
  2. Failure caused by unapproved modifications, etc., to the product by the user.
  3. When the Mitsubishi product is assembled into a user's device, failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
  4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
  5. Failure caused by external irresistible forces such as fires or abnormal voltages, and failure caused by force majeure such as earthquakes, lightning, wind and water damage.
  6. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
  7. Any other failure found to not be the responsibility of Mitsubishi or the user.

## 2. Onerous repair term after discontinuation of production

- (1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued. Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
- (2) Product supply (including repair parts) is not possible after production is discontinued.

## 3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

## 4. Exclusion of chance loss and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to damages caused by any cause found not to be the responsibility of Mitsubishi, chance losses, lost profits incurred to the user by failures in Mitsubishi products, damages and secondary damages caused from special reasons regardless of Mitsubishi's expectations, compensation for accidents, and compensation for damages to products other than Mitsubishi products and other duties.

## 5. Changes in product specifications

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.

## 6. Product application

- (1) In using the Mitsubishi MELSEC programmable logic controller, the usage conditions shall be that the application will not lead to a major accident even if any problem or fault should occur in the programmable logic controller device, and that backup and fail-safe functions are systematically provided outside of the device for any problem or fault.
- (2) The Mitsubishi general-purpose programmable logic controller has been designed and manufactured for applications in general industries, etc. Thus, applications in which the public could be affected such as in nuclear power plants and other power plants operated by respective power companies, and applications in which a special quality assurance system is required, such as for each Japan Railways company or the Department of Defense shall be excluded from the programmable logic controller applications.

Note that even with these applications, if the user approves that the application is to be limited and a special quality is not required, application shall be possible.

When considering use in aircraft, medical applications, railways, incineration and fuel devices, manned transport devices, equipment for recreation and amusement, and safety devices, in which human life or assets could be greatly affected and for which a particularly high reliability is required in terms of safety and control system, please consult with Mitsubishi and discuss the required specifications.
